Methods in Healthcare Frederick W. Faltin, Ron S. Kenett, Fabrizio Ruggeri, 2012-07-24 Statistical Methods in Healthcare In recent years the number of innovative medicinal products and devices submitted and approved by regulatory bodies has declined dramatically The medical product development process is no longer able to keep pace with increasing technologies science and innovations and the goal is to develop new scientific and technical tools and to make product development processes more efficient and effective Statistical Methods in Healthcare focuses on the application of statistical methodologies to evaluate promising alternatives and to optimize the performance and demonstrate the effectiveness of those that warrant pursuit is critical to success Statistical methods used in planning delivering and monitoring health care as well as selected statistical aspects of the development and or production of pharmaceuticals and medical devices are also addressed With a focus on finding solutions to these challenges this book Provides a comprehensive in depth treatment of statistical methods in healthcare along with a reference source for practitioners and specialists in health care and drug development Offers a broad coverage of standards and established methods through leading edge techniques Uses an integrated case study based approach with focus on applications Looks at the use of analytical and monitoring schemes to evaluate therapeutic performance Features the application of modern quality management systems to clinical practice and to pharmaceutical development and production processes Addresses the use of modern statistical methods such as Adaptive Design Seamless Design Data Mining Bayesian networks and Bootstrapping that can be applied to support the challenging new vision Practitioners in healthcare related professions ranging from clinical trials to care delivery to medical device design as well as statistical researchers in the field will benefit from this book **Future Perspectives in Risk Models**

and Finance Alain Bensoussan, Dominique Guegan, Charles S. Tapiero, 2014-11-20 This book provides a perspective on a number of approaches to financial modelling and risk management It examines both theoretical and practical issues Theoretically financial risks models are models of a real and a financial uncertainty based on both common and private information and economic theories defining the rules that financial markets comply to Financial models are thus challenged

by their definitions and by a changing financial system fueled by globalization technology growth complexity regulation and the many factors that contribute to rendering financial processes to be continuously questioned and re assessed The underlying mathematical foundations of financial risks models provide future guidelines for risk modeling The book s chapters provide selective insights and developments that can contribute to better understand the complexity of financial modelling and its ability to bridge financial theories and their practice Future Perspectives in Risk Models and Finance begins with an extensive outline by Alain Bensoussan et al of GLM estimation techniques combined with proofs of fundamental results Applications to static and dynamic models provide a unified approach to the estimation of nonlinear risk models A second section is concerned with the definition of risks and their management In particular Guegan and Hassani review a number of risk models definition emphasizing the importance of bi modal distributions for financial regulation An additional chapter provides a review of stress testing and their implications Nassim Taleb and Sandis provide an anti fragility approach based on skin in the game To conclude Raphael Douady discusses the noncyclical CAR Capital Adequacy Rule and their effects of aversion of systemic risks A third section emphasizes analytic financial modelling approaches and techniques Tapiero and Vallois provide an overview of mathematical systems and their use in financial modeling These systems span the fundamental Arrow Debreu framework underlying financial models of complete markets and subsequently mathematical systems departing from this framework but yet generalizing their approach to dynamic financial models Explicitly models based on fractional calculus on persistence short memory and on entropy based non extensiveness Applications of these models are used to define a modeling approach to incomplete financial models and their potential use as a measure of incompleteness Subsequently Bianchi and Pianese provide an extensive overview of multi fractional models and their important applications to Asset price modeling Finally Tapiero and Jinquyi consider the binomial pricing model by discussing the effects of memory on the pricing of asset prices
