Maximal Orders:

   Maximal Orders Irving Reiner,1975 This is a reissue of a classic text which includes the author s own corrections and provides a very accessible self contained introduction to the classical theory of orders and maximal orders over a Dedekind ring It starts with a long chapter that provides the algebraic prerequisites for this theory covering basic material on Dedekind domains localizations and completions as well as semisimple rings and separable algebras This is followed by an introduction to the basic tools in studying orders such as reduced norms and traces discriminants and localization of orders The theory of maximal orders is then developed in the local case first in a complete setting and then over any discrete valuation ring This paves the way to a chapter on the ideal theory in global maximal orders with detailed expositions on ideal classes the Jordan Zassenhaus Theorem and genera This is followed by a chapter on Brauer groups and crossed product algebras where Hasse s theory of cyclic algebras over local fields is presented in a clear and self contained fashion Assuming a couple of facts from class field theory the book goes on to present the theory of simple algebras over global fields covering in particular Eichler s Theorem on the ideal classes in a maximal order as well as various results on the KO group and Picard group of orders The rest of the book is devoted to a discussion of non maximal orders with particular emphasis on hereditary orders and group rings The ideas collected in this book have found important applications in the smooth representation theory of reductive p adic groups This text provides a useful introduction to this wide range of topics It is written at a level suitable for beginning postgraduate students is highly suited to class teaching and provides a wealth of exercises

   Selected Works of Maurice Auslander Maurice Auslander,1999 Auslander made contributions to many parts of algebra and this 2 volume set the set ISBN is 0 8218 0679 3 already published contains a selection of his main work   Graded Orders F.M., van Oystaeyen,2012-12-06 In a clear well developed presentation this book provides the first systematic treatment of structure results for algebras which are graded by a goup The fruitful method of constructing graded orders of special kind over a given order culminating in applications of the construction of generalized Rees rings associated to divisors is combined with the theory of orders over graded Krull domains This yields the construction of generalized Rees rings corresponding to the central ramification divisor of the orders and the algebraic properties of the constructed orders The graded methods allow the study of regularity conditions on order The book also touches upon representation theoretic methods including orders of finite representation type and other aspects of this theory applicable to the classification of orders The final chapter describes the ring theoretical approach to the classification of orders of global dimension two originally carried out by M Artin using more geometrical methods Since its subject is important in many research areas this book will be valuable reading for all researchers and graduate students with an interest in non commutative algebra

Reid,2013-04-17 For the past 25 years the Geometrization Program of Thurston has been a driving force for research in 3 manifold topology This has inspired a surge of activity investigating hyperbolic 3 manifolds and Kleinian groups as these manifolds form the largest and least well understood class of compact 3 manifolds Familiar and new tools from diverse areas of mathematics have been utilized in these investigations from topology geometry analysis group theory and from the point of view of this book algebra and number theory This book is aimed at readers already familiar with the basics of hyperbolic 3 manifolds or Kleinian groups and it is intended to introduce them to the interesting connections with number theory and the tools that will be required to pursue them While there are a number of texts which cover the topological geometric and analytical aspects of hyperbolic 3 manifolds this book is unique in that it deals exclusively with the arithmetic aspects which are not covered in other texts Colin Maclachlan is a Reader in the Department of Mathematical Sciences at the University of Aberdeen in Scotland where he has served since 1968 He is a former President of the Edinburgh Mathematical Society Alan

Reid is a Professor in the Department of Mathematics at The University of Texas at Austin He is a former Royal Society University Research Fellow Alfred P Sloan Fellow and winner of the Sir Edmund Whittaker Prize from The Edinburgh Mathematical Society Both authors have published extensively in the general area of discrete groups hyperbolic manifolds and low dimensional topology   Categories and Modules with K-Theory in View A. J. Berrick,M. E. Keating,2000-05-25 This book first published in 2000 develops aspects of category theory fundamental to the study of algebraic K theory Ring and module theory illustrates category theory which provides insight into more advanced topics in module theory Starting with categories in general the text then examines categories of K theory This leads to the study of tensor products and the Morita theory The categorical approach to localizations and completions of modules is formulated in terms of direct and inverse limits prompting a discussion of localization of categories in general Finally local global techniques which supply information about modules from their localizations and completions and underlie some interesting applications of K theory to number theory and geometry are considered Many useful exercises concrete illustrations of abstract concepts placed in their historical settings and an extensive list of references are included This book will help all who wish to work in K theory to master its prerequisites   **Quaternion Algebras** John Voight,2021-06-28 This open access textbook presents a comprehensive treatment of the arithmetic theory of quaternion algebras and orders a subject with applications in diverse areas of mathematics Written to be accessible and approachable to the graduate student reader this text collects and synthesizes results from across the literature Numerous pathways offer explorations in many different directions while the unified treatment makes this book an essential reference for students and researchers alike Divided into five parts the book begins with a basic introduction to the noncommutative algebra underlying the theory of quaternion algebras over fields including the relationship to quadratic forms An in depth exploration of the arithmetic of quaternion algebras and orders follows The third part considers analytic aspects starting with zeta functions and then passing to an idelic approach offering a pathway from local to global that includes strong approximation Applications of unit groups of quaternion orders to hyperbolic geometry and low dimensional topology follow relating geometric and topological properties to arithmetic invariants Arithmetic geometry completes the volume including quaternionic aspects of modular forms supersingular elliptic curves and the moduli of QM abelian surfaces Quaternion Algebras encompasses a vast wealth of knowledge at the intersection of many fields Graduate students interested in algebra geometry and number theory will appreciate the many avenues and connections to be explored Instructors will find numerous options for constructing introductory and advanced courses while researchers will value the all embracing treatment Readers are assumed to have some familiarity with algebraic number theory and commutative algebra as well as the fundamentals of linear algebra topology and complex analysis More advanced topics call upon additional background as noted though essential concepts and motivation are recapped throughout   *Hilbert Modular Forms and Iwasawa Theory* Haruzo Hida,2006-06-15 The 1995 work of Wiles and

Taylor Wiles opened up a whole new technique in algebraic number theory and a decade on the waves caused by this incredibly important work are still being felt This book authored by a leading researcher describes the striking applications that have been found for this technique In the book the deformation theoretic techniques of Wiles Taylor are first generalized to Hilbert modular forms following Fujiwara s treatment and some applications found by the author are then discussed With many exercises and open questions given this text is ideal for researchers and graduate students entering this research area

Klingler,Sean Sather-Wagstaff,Janet C. Vassilev,2012-04-26 This is the first of two volumes of a state of the art survey article collection which originates from three commutative algebra sessions at the 2009 Fall Southeastern American Mathematical Society Meeting at Florida Atlantic University The articles reach into diverse areas of commutative algebra and build a bridge between Noetherian and non Noetherian commutative algebra These volumes present current trends in two of the most active areas of commutative algebra non noetherian rings factorization ideal theory integrality and noetherian rings the local theory graded situation and interactions with combinatorics and geometry This volume contains combinatorial and homological surveys The combinatorial papers document some of the increasing focus in commutative algebra recently on the interaction between algebra and combinatorics Specifically one can use combinatorial techniques to investigate resolutions and other algebraic structures as with the papers of Fl ystad on Boij S derburg theory of Geramita Harbourne and Migliore and of Cooper on Hilbert functions of Clark on minimal poset resolutions and of Mermin on simplicial resolutions One can also utilize algebraic invariants to understand combinatorial structures like graphs hypergraphs and simplicial complexes such as in the paper of Morey and Villarreal on edge ideals Homological techniques have become indispensable tools for the study of noetherian rings These ideas have yielded amazing levels of interaction with other fields like algebraic topology via differential graded techniques as well as the foundations of homological algebra analysis via the study of D modules and combinatorics as described in the previous paragraph The homological articles the editors have included in this volume relate mostly to how homological techniques help us better understand rings and singularities both noetherian and non noetherian such as in the papers by Roberts Yao Hummel and Leuschke   **Multiplicative Ideal Theory and Factorization Theory** Scott Chapman,Marco Fontana,Alfred Geroldinger,Bruce Olberding,2016-07-29 This book consists of both expository and research articles solicited from speakers at the conference entitled Arithmetic and Ideal Theory of Rings and Semigroups held September 22 26 2014 at the University of Graz Graz Austria It reflects recent trends in multiplicative ideal theory and factorization theory and brings together for the first time in one volume both commutative and non commutative perspectives on these areas which have their roots in number theory commutative algebra and algebraic geometry Topics discussed include topological aspects in ring theory Pr fer domains of integer valued polynomials and their monadic submonoids and semigroup algebras It will be of interest to practitioners of mathematics and computer science and researchers in multiplicative ideal theory factorization theory number theory and algebraic geometry   D-modules, Representation Theory, and Quantum Groups Louis Boutet de Monvel,Corrado de Concini,Claudio Procesi,Pierre Schapira,Michele Vergne,2006-11-15 CONTENTS L Boutet de Monvel Indice de systemes differentiels C De Concini C Procesi Quantum groups P Schapira J P Schneiders Index theorems for R constructible sheaves and for D modules N Berline M Vergne The equivariant
