Time Series with Long Memory Peter M. Robinson, 2003 Long memory processes constitute a broad class of models for stationary and nonstationary time series data in economics finance and other fields Their key feature is persistence with high correlation between events that are remote in time A single memory parameter economically indexes this persistence as part of a rich parametric or nonparametric structure for the process Unit root processes can be covered along with processes that are stationary but with stronger persistence than autoregressive moving averages these latter being included in a broader class which describes both short memory and negative memory Long memory processes have in recent years attracted considerable interest from both theoretical and empirical researchers in time series and econometrics This book of readings collects articles on a variety of topics in long memory time series including modelling and statistical inference for stationary processes stochastic volatility models nonstationary processes and regression and fractional cointegration models Some of the articles are highly theoretical others contain a mix of theory and methods and an effort has been made to include empirical applications of the main approaches covered A review article introduces the other articles but also attempts a broader survey traces the history of the subject and includes a bibliography

Econometrics Volume 2: Topics For Time Series And Large Panel Data Pierre Perron, 2025-08-28 This book is intended for graduate instruction in subjects like econometrics economics environmental science social science and many other fields at the Masters or PhD levels It can be used as a textbook or as a reference guide Several aspects in the book depart from traditional treatments The emphasis is on understanding the main issues concepts and methods in Econometrics how to implement them and how to interpret the results The mathematical aspects are kept to a minimum as the aim is to provide an intuitive understanding of how various parts fit together as opposed to a sophisticated mathematical treatment of the subject Many examples and discussions are provided Hence minimal mathematical pre requisites are needed Extensive references are also provided to dig deeper into the mathematical aspects of the theories The second volume deals with

various estimation and inference methods applicable when using time series data or with panel data having a large time dimension. The treatment covers both stationary and non-stationary i.e. unit root data as well as long memory processes. Also covered extensively are issues related to structural change including estimation and inference methods with stationary and or non-stationary data related issues in the context of forecasting and methods to address the interplay between changes in trends and unit roots.
