**High-Order Harmonics Generation in Plasmas** Rashid A. Ganeev, 2022-08-01 This book comprises a detailed consideration of novel approaches developed in the field of frequency conversion of laser sources in laser induced plasmas during the last few years. The aim of the book is to support researchers and other readers in their development in the area of high order nonlinear spectroscopy. Particularly the advanced studies of nanoparticles and quantum dots for the formation of new sources of radiation in different short wavelength spectral ranges show the ways to further implement the specific features of small sized species in a relatively new field of study laser ablation induced high order harmonics generation spectroscopy. Researchers involved in the development of new methods of frequency conversion will benefit from finding the most recent advances in this field. Undergraduate students will discover interesting information about recent findings in plasma harmonic research. Additionally the usefulness of the book will be demonstrated by the potential applications of the new knowledge developed during recent years for ultrafast pulse generation using the proposed schemes of plasma light interaction. Thus the audience may also include those researchers involved in state of the art developments in attophysics. Additionally any professionals interested in the application of the advanced techniques for material science will also benefit from updating their knowledge of new methods of material studies using high order nonlinear spectroscopy.      **Crystal**

*Uncertainties in Acoustical Transfer Functions* Pascal Dietrich, 2013 Measured transfer functions of acoustic systems are often used to derive single number parameters The uncertainty analysis is commonly focused on the derived parameters but not on the transfer function as the primary quantity This thesis presents an approach to assess the uncertainty contributions in these transfer functions by using analytic models Uncertainties caused by the measurement method are analyzed with a focus on the underlying signal processing In particular the influence of nonlinearities in the acoustic measurement chain are modeled to predict artifacts in the measured signals and hence the calculated acoustic transfer function Secondly characterization methods commonly applied in the field of signal processing are linked to the acoustic scenarios and the main influencing parameters Acoustic parameters are then derived analytically and by means of Monte Carlo simulations considering the uncertainty of these input parameters In order to provide airborne applications analytic models for sound barrier and room acoustic measurements are developed incorporating the directivity and the orientation of the sound source as well as the positions of sources and receivers The simulated uncertainty contributions are validated by measurements The same approach is also applied to structure borne sound applications
