**Abstract:** In the present work we applied the nonequilibrium thermodynamic theory in the analysis of the dielectric breakdown (DB) process. As the tree channel front moves, the intense field near the front moves electrons and ions irreversibly in the region beyond the tree channel tips where electromechanical, thermal and chemical effects cause irreversible damage and, from the nonequilibrium thermodynamic viewpoint, entropy production. From the nonequilibrium thermodynamics analysis, the entropy production is due to the product of fluxes  $J$  and conjugated forces  $X$ :  $\sigma = \sum J_i X_i \geq 0$ . We consider that the coupling between fluxes can describe the dielectric breakdown in solids as a phenomenon of transport of heat, mass and electric charge.

**Keywords:** entropy production; dielectric breakdown; nonequilibrium thermodynamics

## 1. Introduction

All materials conduct electricity to a greater or lesser extent and all suffer some form of breakdown in a sufficiently strong electric field.

For low field strengths the conduction process is ohmic, but as the field strength is increased, the conductivity usually becomes field-dependent; if the field strength is increased further, some form of destructive irreversible conduction takes place [1]: the dielectric breakdown.

Gases and liquids due to the mobility of their molecules do not present permanent damage (channels) when the application of the field ceases, something that does happen in solids. The permanence of these channels in the dielectric breakdown of solids is attributed to thermal effects: local fusion of the material that originates the formation of the channel and gives rise to the transport of ion or electron carriers within it.

Dielectric solids usually exhibit a permanently damaged discharge track.

In a recently published work [2], we have made an analysis of the entropy associated with the structure of electric trees through the behavior of four entropies in the field of statistical mechanics in the framework of the DBM Dielectric Breakdown Modell [3].

Historically, the treatment of the simulation of the dielectric breakdown has placed emphasis only on the electric field, particularly in the local field, as the sole cause of the dielectric breakdown, omitting perhaps other factors such as the thermal effect or the presence of moisture. The latter usually affects the structure of the insulating material in high-voltage transformers.

In this work, we will try to correlate the entropy production associated with the simulation process of the structure formed by means of the DBM model with observables of real systems. In other words, we will try to give physical meaning to the simulated discharge within the framework
