

Transvenous or Epicardial Cardiac Pacing

Transvenous pacing:

Transvenous pacing is a form of electrical stimulation. Used to treat bradycardia (slow heart rate) or tachycardia (fast heart rate) to reestablish normal heart rhythm. It involves placing electrodes (leads) connected to a pacemaker generator (external pacer box).

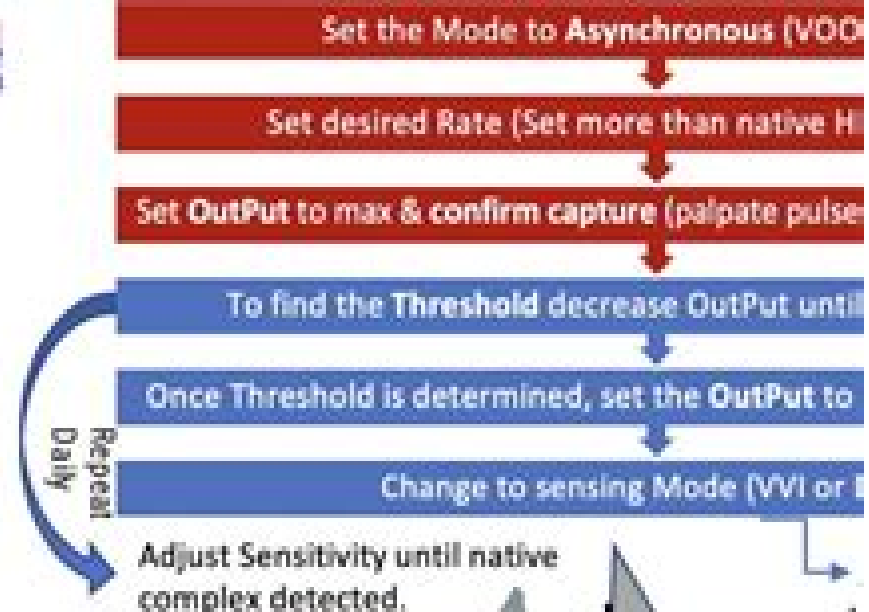

Transvenous pacing is more reliable & resilient

Transvenous pacing is used during cardiac surgery.

Transvenous pacing: use of large electrodes current through a large surface area

Transvenous pacing: ideal for atrial pacing and/or ventricular pacing. Unreliable.

Transvenous pacing: reliability due to a bradycardia or heart block. Electrolyte imbalance, toxicities. Transvenous pacing is used to suppress arrhythmia by delivering a current faster than current arrhythmia (e.g. torsade's de pointes) decreasing the risk of arrhythmia is inhibited.

Atlee III, H. Gombotz, K.H. Tscheliessnigg, 2012-12-06 A symposium Perioperative Management of Pacemaker Patients was held in May 1990 at the Karl Franzens Universitat Landeskrankenhaus Graz Austria The purpose of the symposium organized by the Departments of Anesthesiology and Surgery was to discuss the current status of permanent pacemaker technology emerging developments in this field legal issues indications and methods for temporary perioperative pacing and the potential for pacemaker malfunction and adverse patient pacemaker interactions in perioperative and other medical settings It was hoped that participants would come to some consensus concerning recommendations for satisfactory perioperative

management of pacemaker patients This symposium was probably the first occasion ever that brought together representatives of the pacemaker industry implanting physicians and physicians responsible for the management of pacemaker patients in perioperative and other hospital settings to discuss these important matters Certainly it was recognized by all who attended that there existed at the time little in the way of substantial knowledge of how to best manage pacemaker patients or patients with possible indications for temporary pacing in unique hospital settings especially with exposure to electromagnetic and other potential interference but in the absence of professional persons with direct knowledge of pacemakers and related devices Much new information was presented and useful ideas exchanged so that three symposium participants were of the opinion that papers presented at this meeting should be published as a collective work

Acute Coronary Care 1987 Robert M. Califf, G.S. Wagner, 2012-12-06 During the 25 years since acute coronary care was focused into Coronary Care Units there have been three major Phases I prevention of death caused by arrhythmias II prevention of death due to myocardial failure and III limitation of infarct size In the latter two Phases there has been infringement upon the time honored concept of a prolonged period of rest for the patient in general and the heart in particular to minimize myocardial metabolic demands During the second Phase of coronary care patients with myocardial failure received aggressive measures to increase cardiac work via increase in preload decrease in afterload and direct increase in inotropy It was believed that true cardiogenic shock was so irreversible that it should be prevented by vigorous efforts to improve the cardiac output despite the risk of extending the area of ischemic myocardium However Phase II produced minimal overall reduction in mortality In the initial part of Phase III myocardial infarct MI size limitation was attempted by reducing myocardial metabolic demands via either beta adrenergic or calcium channel blocking agents We are currently several years into the second part of Phase III of coronary care where the principle means of limiting MI size is restoration of coronary blood flow
