*Regularity Estimates for Nonlinear Elliptic and Parabolic Problems* John Lewis,2012-03-02 The issue of regularity has played a central role in the theory of Partial Differential Equations almost since its inception and despite the tremendous advances made it still remains a very fruitful research field In particular considerable strides have been made in regularity estimates for degenerate and singular elliptic and parabolic equations over the last several years and in many unexpected and challenging directions Because of all these recent results it seemed high time to create an overview that would highlight emerging trends and issues in this fascinating research topic in a proper and effective way The course aimed to show the deep connections between these topics and to

Ladyzhenskaya, 1989 **A Stability Technique for Evolution Partial Differential Equations** Victor A. Galaktionov, Juan Luis Vázquez, 2012-12-06 common feature is that these evolution problems can be formulated as asymptotically small perturbations of certain dynamical systems with better known behaviour Now it usually happens that the

perturbation is small in a very weak sense hence the difficulty or impossibility of applying more classical techniques Though the method originated with the analysis of critical behaviour for evolution PDEs in its abstract formulation it deals with a nonautonomous abstract differential equation  $U_t = A u + C u$  where  $u$  has values in a Banach space like an LP space  $A$  is an autonomous time independent operator and  $C$  is an asymptotically small perturbation so that  $C u \rightarrow 0$  along orbits  $u(t)$  of the evolution in a sense to be made precise which in practice can be quite weak We work in a situation in which the autonomous limit differential equation  $U_t = A u$  has a well known asymptotic behaviour and we want to prove that for large times the orbits of the original evolution problem converge to a certain class of limits of the autonomous equation More precisely we want to prove that the orbits of NDE are attracted by a certain limit set of ADE which may consist of equilibria of the autonomous equation or it can be a more complicated object

**Sobolev and Viscosity Solutions for Fully Nonlinear Elliptic and Parabolic Equations** N. V. Krylov, 2018-09-07 This book concentrates on first boundary value problems for fully nonlinear second order uniformly elliptic and parabolic equations with discontinuous coefficients We look for solutions in Sobolev classes local or global or for viscosity solutions Most of the auxiliary results such as Aleksandrov's elliptic and parabolic estimates the Krylov Safonov and the Evans Krylov theorems are taken from old sources and the main results were obtained in the last few years Presentation of these results is based on a generalization of the Fefferman Stein theorem on Fang Hua Lin's like estimates and on the so called ersatz existence theorems saying that one can slightly modify any equation and get a cut off equation that has solutions with bounded derivatives These theorems allow us to prove the solvability in Sobolev classes for equations that are quite far from the ones which are convex or concave with respect to the Hessians of the unknown functions In studying viscosity solutions these theorems also allow us to deal with classical approximating solutions thus avoiding sometimes heavy constructions from the usual theory of viscosity solutions
