Nonlinear Diffusion Research Notes In Mathematics Ser No 14:

Shock Waves and Reaction—Diffusion Equations Joel Smoller, 2012-12-06 the progress of physics will to a large extent depend on the progress of nonlinear mathematics of methods to solve nonlinear equations and therefore we can learn by comparing different nonlinear problems WERNER HEISENBERG I undertook to write this book for two reasons First I wanted to make easily available the basics of both the theory of hyperbolic conservation laws and the theory of systems of reaction diffusion equations including the generalized Morse theory as developed by C Conley These important subjects seem difficult to learn since the results are scattered throughout the research journals 1 Second I feel that there is a need to present the modern methods and ideas in these fields to a wider audience than just mathematicians Thus the book has some rather sophisticated aspects to it as well as certain textbook aspects The latter serve to explain somewhat the reason that a book with the title *Shock Waves and Reaction Diffusion Equations* has the first nine chapters devoted to linear partial differential equations More precisely I have found from my classroom experience that it is far easier to grasp the subtleties of nonlinear partial differential equations after one has an understanding of the basic notions in the linear theory This book is divided into four main parts linear theory reaction diffusion equations shock wave theory and the Conley index in that order Thus the text begins with a discussion of ill posed problems

Nonlinear PDEs Guido Schneider, Hannes Uecker, 2017-10-26 This is an introductory textbook about nonlinear dynamics of PDEs with a focus on problems over unbounded domains and modulation equations The presentation is example oriented and new mathematical tools are developed step by step giving insight into some important classes of nonlinear PDEs and nonlinear dynamics phenomena which may occur in PDEs The book consists of four parts Parts I and II are introductions to finite and infinite dimensional dynamics defined by ODEs and by PDEs over bounded domains respectively including the basics of bifurcation and attractor theory Part III introduces PDEs on the real line including the Korteweg de Vries equation the Nonlinear Schrödinger equation and the Ginzburg Landau equation These examples often occur as simplest possible models namely as amplitude or modulation equations for some real world phenomena such as nonlinear waves and pattern formation Part IV explores in more detail the connections between such complicated physical systems and the reduced models For many models a mathematically rigorous justification by approximation results is given The parts of the book are kept as self contained as possible The book is suitable for self study and there are various possibilities to build one or two semester courses from the book
