

has threatened to put at least a minor dent in UT's plans. The most conspicuous of these is the recent drop in oil prices.

This is having a two-pronged impact on the university's finances. It is slowing the growth of the permanent fund and playing havoc with state revenues, which in turn could mean smaller increases in appropriations for higher education.

Last year, university officials were predicting that the permanent fund would climb to more than \$4 billion by the early 1990's, and that it would yield over \$300 million a year in income—more than double the current available fund. If oil prices remain depressed for a few years, the fund will grow more slowly, but it is still expected to reach \$3 billion by the end of the decade.

That level scarcely suggests that UT is entering a period of financial hardship.

But the problem is that just as the growth rate of the permanent fund is tapering off, more claimants are clamoring for its resources. Under the state constitution, only certain units of the UT system can now use construction money generated by borrowing against the permanent fund, but a bill before the legislature would make the entire system eligible for a share in the pot. (The units that would be added are mostly those parts of the system that have been established in the past decade or so.) As a result, construction funds are likely to be stretched more thinly. The university has therefore proposed that the borrowing limit be raised from 20 to 30 percent of the value of the permanent fund. That would increase the total available for construction, but it would also mean that more of the income from the permanent fund would be tied up in paying off the debt.

A trend that may bring some relief from these difficulties is a slowdown in the growth of students entering higher education, which means that the demand for new classrooms, dormitories, and similar buildings will ease. In the past 4 years alone, the student population at UT Austin has expanded from 40,000 to 48,000. But, thanks partly to tighter admission requirements, last fall's enrollment leveled off.

Even if oil prices remain depressed and the resources derived from the permanent fund are spread more thinly, however, UT has clearly got itself into an enviable position. "We are part of the general economy, and I don't expect we can go entirely unscathed," says Flawn. But, unlike many other public universities that are having to cut back to cope with budget shocks, UT now has a substantial cushion.—**COLIN NORMAN**

Scientists Settle Cell Line Dispute

But question of claiming ownership based on family ties to cell donor is sidestepped

San Diego—In July 1982, Ivor Royston, an oncologist at the University of California at San Diego, learned a bit of news, disclosed in passing at an office party, that he says "blew my mind." Royston was told that a visiting Japanese researcher had carried off part of a promising new cell line without permission. Hideaki Hagiwara had taken the cells back to Japan, hoping eventually to treat his mother, who was dying of cervical cancer. The cell line was a hybridoma, which is a fusion of two cells and a type of gene-splicing product of enormous scientific and commercial interest.

In the months to come, Royston, an associate professor, and Hagiwara, a young postdoctoral fellow, became embroiled in a debate over rightful ownership of the hybridoma, and proper credit for the research. The controversy was considerably complicated by another factor: the hybridoma was derived from cells taken from Hagiwara's mother. In an unusual argument, Hagiwara claimed ownership of the cells because of family ties. Last month the dispute was finally settled.

The cell line had a rare combination of properties that the researchers had not seen in other hybridomas. Researchers hope to use the monoclonal antibodies made by hybridomas as a possible can-

cer treatment. The hybridoma in dispute was a fusion of lymphocytes from Hagiwara's mother and human cells called UC 729-6, an established cell line developed at San Diego. In preliminary tests in Royston's lab, this hybridoma produced a monoclonal antibody which did not react with samples of normal cells, such as blood and fibroblasts. The test results were encouraging and an

indication that the antibody might not cause side effects if administered to a cancer patient. Furthermore, the antibody did react with cancerous cells from the cervix, lung, colon, and prostate. According to Royston, no other human-human hybridoma has shown similar behavior.

Hagiwara and Royston contested ownership of the cells, each claiming the more significant contribution to the project. Hagiwara, in addition to arguing a familial relationship, said it was he who proposed the idea of the fusion and that Royston's lab had simply carried out the technical task. Royston, however, maintained that his group actually created the hybridoma. Hagiwara "didn't realize the art and expertise involved," Royston says.

As details of the case unfolded, Royston became increasingly suspicious that the Japanese scientist had spirited away the cells to exploit them commercially. He learned, for example, that Hagiwara's father, a physician, is owner of the Hagiwara Institute of Health and president of Japanese Pharmaceutical Development Company, Inc., a health food concern. He discovered that Hagiwara had written a manuscript about the hybridoma that had not included Royston's staff as coauthors. Further-
