Evgenii Borisovich Dynkin, Gary M. Seitz, 2000 Eugene Dynkin is a rare example of a contemporary mathematician who has achieved results in two quite different areas of research algebra and probability In both areas his ideas constitute an essential part of modern mathematical knowledge and form a basis for further development Although his last work in algebra was published in 1955 his contributions continue to influence current research in algebra and in the physics of elementary particles His work in probability is part of both the historical and the modern development of the topic **Modeling**

Uncertainty Moshe Dror, Pierre L'Ecuyer, Ferenc Szidarovszky, 2019-11-05 Modeling Uncertainty An Examination of Stochastic Theory Methods and Applications is a volume undertaken by the friends and colleagues of Sid Yakowitz in his honor Fifty internationally known scholars have collectively contributed 30 papers on modeling uncertainty to this volume Each of these papers was carefully reviewed and in the majority of cases the original submission was revised before being accepted for publication in the book The papers cover a great variety of topics in probability statistics economics stochastic optimization control theory regression analysis simulation stochastic programming Markov decision process application in the HIV context and others There are papers with a theoretical emphasis and others that focus on applications A number of papers survey the work in a particular area and in a few papers the authors present their personal view of a topic It is a book with a considerable number of expository articles which are accessible to a nonexpert a graduate student in mathematics statistics engineering and economics departments or just anyone with some mathematical background who is interested in a preliminary exposition of a particular topic Many of the papers present the state of the art of a specific area or represent original contributions which advance the present state of knowledge In sum it is a book of considerable interest to a broad range of academic researchers and students of stochastic systems Proceedings of the Seventh Conference on Probability

Athreya, Peter E. Ney, 2012-12-06 The purpose of this book is to give a unified treatment of the limit theory of branching processes Since the publication of the important book of T E Harris Theory of Branching Processes Springer 1963 the subject has developed and matured significantly Many of the classical limit laws are now known in their sharpest form and there are new proofs that give insight into the results Our work deals primarily with this decade and thus has very little overlap with that of Harris Only enough material is repeated to make the treatment essentially self contained For example certain foundational questions on the construction of processes to which we have nothing new to add are not developed There is a natural classification of branching processes according to their criticality condition their time parameter the single or multi type particle cases the Markovian or non Markovian character of the process etc We have tried to avoid the rather uneconomical and unenlightening approach of treating these categories independently and by a series of similar but increasingly complicated techniques The basic Galton Watson process is developed in great detail in Chapters I and II **Notices of the American Mathematical Society** American Mathematical Society, 1974 Contains articles of significant interest to mathematicians including reports on current mathematical research Proceedings of the Sixth Berkeley Symposium on Mathematical Statistics and Probability, Volume III Lucien M. Dynamic Programming and Optimal Control Dimitri Bertsekas, 2012 This is the leading and most up to date textbook on the far ranging algorithmic methodology of Dynamic Programming which can be used for optimal control Markovian decision problems planning and sequential decision making under uncertainty and discrete combinatorial optimization The treatment focuses on basic unifying themes and conceptual foundations It illustrates the versatility power and generality of the method with many examples and applications from engineering operations research and other fields It also addresses extensively the practical application of the methodology possibly through the use of approximations and provides an extensive treatment of the far reaching methodology of Neuro Dynamic Programming Reinforcement Learning Among its special features the book 1 provides a unifying framework for sequential decision making 2 treats simultaneously deterministic and stochastic control problems popular in modern control theory and Markovian decision popular in operations research 3 develops the theory of deterministic optimal control problems including the Pontryagin Minimum Principle 4 introduces recent suboptimal control and simulation based approximation techniques neuro dynamic programming which allow the practical application of dynamic programming to complex problems that involve the dual curse of large dimension and lack of an accurate mathematical model 5 provides a comprehensive treatment of infinite horizon problems in the second volume and an introductory treatment in the first volume The electronic version of the book includes 29 theoretical problems with high quality solutions which enhance the range of coverage of the book

Generalized Functions, Volume 4 I. M. Gel'fand, N. Ya. Vilenkin, 2016-04-19 The first systematic theory of generalized functions also known as distributions was created in the early 1950s although some aspects were developed much earlier most notably in the definition of the Green's function in mathematics and in the work of Paul Dirac on quantum electrodynamics in physics The six volume collection Generalized Functions written by I M Gel'fand and co authors and published in Russian between 1958 and 1966 gives an introduction to generalized functions and presents various applications to analysis PDE stochastic processes and representation theory The main goal of Volume 4 is to develop the functional analysis setup for the universe of generalized functions The main notion introduced in this volume is the notion of rigged Hilbert space also known as the equipped Hilbert space or Gelfand triple Such space is in fact a triple of topological vector spaces $E \subset H \subset E'$ where H is a Hilbert space E is dual to E' and inclusions $E \subset H$ and $H \subset E'$ are nuclear operators The book is devoted to various applications of this notion such as the theory of positive definite generalized functions the theory of generalized stochastic processes and the study of measures on linear topological spaces
