Shell and Spatial Structures: Computational Aspects Guido De Roeck, Avelino Samartin Quiroga, Marcel A.V.A. Van Laethem, Edgard Backx, 2013-03-13 In recent years powerful engineering workstations for a reasonable price become a valuable tool for the design of complicated constructions such as shell and spatial structures This availability causes an increasing use of advanced numerical techniques for the static and dynamic analysis of these structures also in the non linear range The I A S S Working Group nO 13 concerned with Numerical Methods in Shell and Spatial Structures and the Department of Civil Engineering of the Katholieke Universiteit Leuven have taken the initiative to organise an International Symposium providing a forum for discussion and exchange of views between researchers specialists in numerical analysis on one hand and designers practising engineer ings on the other hand These Proceedings contain the papers presented at the Symposium held in Leuven July 14 16 1986 The papers are organised in five sections 1 Shell structures 2 Spatial structures 3 Dynamic analysis 4 Non linear analysis 5 Presentation and interpretation of results The papers covering more than one domain are classified following the main subject We hope that researchers as well as practising engineers will find a lot of useful information in the book

Construction Matters Stefan Holzer, Silke Langenberg, Clemens Knobling, Orkun Kasap, 2025-03-04 Construction History Construction Heritage Recent Construction Historiography Industrialization Engineering Sciences Building Materials Building Actors Construction History is still a fairly new and small but quickly evolving field The current trends in Construction History are well reflected in the papers of the present conference Construction History has strong roots in the historiography of the 19th century and the evolution of industrialization but the focus of our research field has meanwhile shifted notably to include more recent and also more distant histories as well This is reflected in these conference proceedings where 65 out of 148 contributed papers deal with the built heritage or building actors of the 20th or 21st century The conference also mirrors the wide spectrum of documentary and analytical approaches comprised within the discipline of Construction History Papers dealing with the technical and functional analysis of specific buildings or building types are complemented by other studies focusing on the lives and formation of building actors from laborers to architects and engineers from economical aspects to social and political implications on legal aspects and the strong ties between the history of construction and the history of engineering sciences The conference integrates perfectly into the daily work at the Institute for Preservation and Construction History at ETH Zurich Its two chairs the Chair for Building Archaeology and Construction History and the Chair for Construction Heritage and Preservation endeavor to cover the entire field and to bridge the gaps between the different approaches methodologies and disciplines between various centuries as well as technologies learning together and from each other The proceedings of 8ICCH give a representative picture of the state of the art in the field and will serve as a reference point for future studies

laboratory testing numerical modeling and structural analysis management of heritage structures and conservation strategies structural health monitoring repair and strengthening strategies and techniques vernacular constructions seismic analysis and retrofit vulnerability and risk analysis resilience of historic areas to climate change and hazard events durability and sustainability As such the book represents an invaluable up to the minute tool providing an essential overview of conservation of historical constructions and offers an important platform to engineers architects archeologists and geophysicists Chapter Guidelines for Seismic Retrofitting of Earthen Historic Buildings in Peru and Latin America is available open access under a Creative Commons Attribution 4.0 International License via link [springer.com](https://www.springer.com) Stability and Optimization of Flexible Space Structures S.J. Britvec, 2012-12-06 The aim of this book is to present up to date methodologies in the analysis and optimization of the elastic stability of lightweight statically determinate and in determinate space structures made of flexible members which are highly stiff when loaded centrally at the nodes These are flat and curved space pin connected open or enveloped lattices and reticulated shells which due to their high loadbearing capacity to weight ratios are gaining in importance in aerospace and other fields They are utilized for example in space stations as support structures for large radio telescopes and for other equipment on earth and in outer space as roof structures for the coverage and enclosure of large areas on earth and as underwater shell type structures enveloped by a cover shell capable of withstanding high hydrostatic pressures Space structures of this type are generally subjected to considerable internal axial loads in the flexible members and they fail through the loss of global statical stability usually precipitated by the intrinsic small imperfections at finite near critical elastic deformations and not primarily by the the break down of the material of which they are made as is the case in conventional systems Thus the criterion in the design of such structures calls for eliminating or isolating the onset of the elastic dynamic collapse thereby increasing their safe stability limit Standard finite element methods as they are employed by most users today are totally inadequate for such analyses since they do not account for the choice of the branching paths in the loading process of the structure nor for the existence of the relevant collapse modes These aspects are novel and they are presented here for the first time in comprehensive book form
