Claudio,2011-06-07 This book features selected papers from the international conference MAF 2008 that cover a wide variety of subjects in actuarial insurance and financial fields all treated in light of the successful cooperation between mathematics and statistics *Hedging Derivatives* Thorsten Rheinlander,Thorsten Rheinlander,Jenny Sexton,2011 Valuation and hedging of financial derivatives are intrinsically linked concepts Choosing appropriate hedging techniques depends on both the type of derivative and assumptions placed on the underlying stochastic process This volume provides a systematic treatment of hedging in incomplete markets Mean variance hedging under the risk neutral measure is applied in the framework of exponential Levy processes and for derivatives written on defaultable assets It is discussed how to complete markets based upon stochastic volatility models via trading in both stocks and vanilla options Exponential utility indifference pricing is explored via a duality with entropy minimization Backward stochastic differential equations offer an alternative approach and are moreover applied to study markets with trading constraints including basis risk A range of optimal martingale measures are discussed including the entropy Esscher and minimal martingale measures Quasi symmetry properties of stochastic processes are deployed in the semi static hedging of barrier options This book is directed towards both graduate students and researchers in mathematical finance and will also provide an orientation to applied mathematicians financial economists and practitioners wishing to explore recent progress in this field *Introduction to Econophysics* Carlo Requião da Cunha,2021-10-29 Econophysics explores the parallels between physics and economics and is an exciting topic that is attracting increasing attention However there is a lack of literature that explains the topic from a broad perspective This book introduces advanced undergraduates and graduate students in physics and engineering to the topic from this outlook and is accompanied by rigorous mathematics which ensures that this will also be a good guide for established researchers in the field as well as researchers from other fields such as mathematics and statistics who are interested in the topic Key features Presents a multidisciplinary approach that will be of interest to students and researchers from physics engineering mathematics statistics and other physical sciences Accompanied by Python code with further learning opportunities available for readers to download from the CRC Press website Accessible to both students and researchers Carlo R da Cunha is an

associate professor of physics and engineering physics at the Universidade Federal do Rio Grande do Sul Brazil and has been since 2011 Dr da Cunha received his M Sc Degree from the West Virginia University in 2001 and his Ph D degree from Arizona State University in 2005 He was a postdoctoral researcher at McGill University in Canada in 2006 and an assistant professor of engineering at the University Federal de Santa Catarina between 2007 and 2011 He has been a guest professor at the Technische Universit t Wien Austria Chiba University Japan and Arizona State University US His research revolves around the physics of complex systems where he has been drawing parallels between physical and economic systems from quantum to social levels To access additional resources please take a lookhere

PDE and Martingale Methods in Option Pricing Andrea Pascucci, 2011-04-15 This book offers an introduction to the mathematical probabilistic and numerical methods used in the modern theory of option pricing The text is designed for readers with a basic mathematical background The first part contains a presentation of the arbitrage theory in discrete time In the second part the theories of stochastic calculus and parabolic PDEs are developed in detail and the classical arbitrage theory is analyzed in a Markovian setting by means of PDEs techniques After the martingale representation theorems and the Girsanov theory have been presented arbitrage pricing is revisited in the martingale theory optics General tools from PDE and martingale theories are also used in the analysis of volatility modeling The book also contains an Introduction to Levy processes and Malliavin calculus The last part is devoted to the description of the numerical methods used in option pricing Monte Carlo binomial trees finite differences and Fourier transform

Local Density of Solutions to Fractional Equations Alessandro Carbotti, Serena Dipierro, Enrico Valdinoci, 2019-08-19 This book presents in a detailed and self contained way a new and important density result in the analysis of fractional partial differential equations while also covering several fundamental facts about space and time fractional equations

Handbook Of Heavy-tailed Distributions In Asset Management And Risk Management Michele Leonardo Bianchi, Stoyan V Stoyanov, Gian Luca Tassinari, Frank J Fabozzi, Sergio Focardi, 2019-03-08 The study of heavy tailed distributions allows researchers to represent phenomena that occasionally exhibit very large deviations from the mean The dynamics underlying these phenomena is an interesting theoretical subject but the study of their statistical properties is in itself a very useful endeavor from the point of view of managing assets and controlling risk In this book the authors are primarily concerned with the statistical properties of heavy tailed distributions and with the processes that exhibit jumps A detailed overview with a Matlab implementation of heavy tailed models applied in asset management and risk managements is presented The book is not intended as a theoretical treatise on probability or statistics but as a tool to understand the main concepts regarding heavy tailed random variables and processes as applied to real world applications in finance Accordingly the authors review approaches and methodologies whose realization will be useful for developing new methods for forecasting of financial variables where extreme events are not treated as anomalies but as intrinsic parts of the economic process

Simulation and Inference for Stochastic Processes with YUIMA Stefano M.

Iacus, Nakahiro Yoshida, 2018-06-01 The YUIMA package is the first comprehensive R framework based on S4 classes and methods which allows for the simulation of stochastic differential equations driven by Wiener process Levy processes or fractional Brownian motion as well as CARMA COGARCH and Point processes The package performs various central statistical analyses such as quasi maximum likelihood estimation adaptive Bayes estimation structural change point analysis hypotheses testing asynchronous covariance estimation lead lag estimation LASSO model selection and so on YUIMA also supports stochastic numerical analysis by fast computation of the expected value of functionals of stochastic processes through automatic asymptotic expansion by means of the Malliavin calculus All models can be multidimensional multiparametric or non parametric The book explains briefly the underlying theory for simulation and inference of several classes of stochastic processes and then presents both simulation experiments and applications to real data Although these processes have been originally proposed in physics and more recently in finance they are becoming popular also in biology due to the fact the time course experimental data are now available The YUIMA package available on CRAN can be freely downloaded and this companion book will make the user able to start his or her analysis from the first page

Differential Operators & Markov Processes Niels Jacob, 2005 This volume concentrates on how to construct a Markov process by starting with a suitable pseudo differential operator Feller processes Hunt processes associated with L_p sub Markovian semigroups and processes constructed by using the Martingale problem are at the center of the considerations The potential theory of these processes is further developed and applications are discussed Due to the non locality of the generators the processes are jump processes and their relations to Levy processes are investigated Special emphasis is given to the symbol of a process a notion which generalizes that of the characteristic exponent of a Levy process and provides a natural link to pseudo differential operator theory Pseudo Differential Operators And Markov Processes, Volume Iii:

diffusion and Lévy processes are evaluated in the context of a stylised investment project. The valuation results suggest that stochastic process choice can have substantial implications for valuation results and optimal investment rules.

New Developments in the Analysis of Nonlocal Operators Donatella Danielli, Arshak Petrosyan, Camelia A. Pop, 2019-02-21 This volume contains the proceedings of the AMS Special Session on New Developments in the Analysis of Nonlocal Operators held from October 28-30, 2016 at the University of St. Thomas, Minneapolis, Minnesota. Over the last decade there has been a resurgence of interest in problems involving nonlocal operators motivated by applications in many areas such as analysis, geometry, and stochastic processes. Problems represented in this volume include uniqueness for weak solutions to abstract parabolic equations with fractional time derivatives, the behavior of the one-phase Bernoulli type free boundary near a fixed boundary and its relation to a Signorini type problem, connections between fractional powers of the spherical Laplacian and zeta functions from the analytic number theory and differential geometry, and obstacle problems for a class of non-stable like nonlocal operators for asset price models widely used in mathematical finance. The volume also features a comprehensive introduction to various aspects of the fractional Laplacian with many historical remarks and an extensive list of references suitable for beginners and more seasoned researchers alike.
