Abstract

Objectives: The objective of this study was to demonstrate the feasibility of using noninvasive photoacoustic imaging technology along with novel semiconducting polymer nanoparticles for in vivo identifying inflammatory components in carotid atherosclerosis and assessing the severity of inflammation using mouse models.

Methods and Results: Healthy carotid arteries and atherosclerotic carotid arteries were imaged in vivo by the noninvasive photoacoustic imaging system. Molecular probes PBD-CD36 were used to label the inflammatory cells to show the inflammation information by photoacoustic imaging. In in vivo imaging experiments, we observed the maximum photoacoustic signal enhancement of 4.3, 5.2, 8 and 14.3 times between 24 h post probe injection and that before probe injection in four carotid arteries belonging to three atherosclerotic mice models. In the corresponding carotid arteries stained with CD36, the ratio of 0.043, 0.061, 0.082 and 0.113 was found between CD36 positive (CD36(+)) expression area and intima-media area ($P < 0.05$). For the CD36(+) expression less than 0.008 in eight arteries, no photoacoustic signal enhancement was found due to the limited system sensitivity. The photoacoustic signal reflects CD36(+) expression in plaques, which shows the feasibility of using photoacoustic imaging for in vivo assessment of carotid atherosclerosis.

Conclusion: This research demonstrates a semiconducting polymer nanoparticle along with photoacoustic technology for noninvasive imaging and assessment of inflammation of carotid atherosclerotic plaques in vivo.

Key words: molecular imaging, PBD-CD36, noninvasive photoacoustic imaging, carotid atherosclerosis, inflammation

Introduction

The vascular system dysfunction due to atherosclerosis is the leading cause of severe health, mortality, and economic problems around the world.

The plaque buildup in the walls of carotid arteries subsequently leads to luminal stenosis, low blood supply to the brain, and even acute stroke incidents

American Heart Association and the Chicago Heart Association The proceedings were published subsequently in a volume
entitled Evolution of the Atherosclerotic Plaque edited by Richard J Jones 1 Both experimental and human lesions were
considered and several provocative new approaches to the disorder were discussed The electron microscope was being
applied systematically to the study of blood vessels at that time so that details of the infrastructure and cellular composition
of the artery wall and of atherosclerotic lesions were presented in some detail There was as one result of these explorations
considerable discussion of morphologic evidence suggesting that the principal cell involved in the atherogenic process was
neither the fibroblast nor the macrophage as had been supposed but the smooth muscle cell In particular the findings
indicated that this cell could incorporate lipid and become a foam cell *Arteriosclerosis, 1981* National Heart, Lung, and
