

Use of Pharmaceuticals in Noninvasive Cardiovascular Diagnosis

Jay S. Meisner, MD,* Jamshid Shirani, MD,* Jamshid Alaeeddini, MD,* William H. Friseman, MD,† and Joel A. Saram, MD†

A number of pharmaceuticals are employed as diagnostic agents for cardiovascular diseases. Four groups of agents are reviewed here: 1) vasoactive substances employed as adjuncts to physical maneuvers in diagnosis of structural heart disease; 2) vasodilators used to produce heterogeneity of coronary flow; 3) sympathomimetic agents simulating the effects of exercise on the heart for the purpose of detection of coronary artery stenosis; and 4) ultrasonic contrast agents used to enhance myocardial imaging for the assessment of segmental wall motion. In the first group are amyl nitrate, a vasodilator, and methoxamine and phenylephrine, both vasopressors. The vasodilators of the second group are dipyridamole and adenosine. When combined with scintigraphic perfusion imaging or with echocardiographic assessment of segmental wall motion, these agents can detect single- or multiple-vessel coronary artery disease with sensitivity and specificity comparable to submaximal exercise. They are especially useful for preoperative risk assessment before noncardiac surgery. The sympathomimetic agents of the third group, dobutamine and arbutamine, increase myocardial contractility and heart rate, and dilate the peripheral vasculature. As with the vasodilators, when combined with nuclear or echocardiographic techniques they are equivalent to exercise in detection of coronary disease. They are especially useful in patients with bronchospastic disease and for assessment of myocardial viability. Agents from groups 2 and 3 have acceptable side-effect and safety profiles. The last group reviewed includes echocardiographic contrast agents that, in this investigative setting, are employed to enhance detection of segmental wall motion when used with agents from groups 2 and 3.

Pharmacologic agents have been used in cardiac diagnosis for years to bring out abnormalities that would not otherwise be detected. Nitrates, pressors, ergonovine, atropine, and more recently dipyridamole, adenosine, dobutamine, and arbutamine have been utilized during diagnostic procedures including physical examination, cardiac catheterization, and stress testing. In this review, we emphasize those drugs used for detecting coronary artery disease and myocardial viability during electrocardiographic (ECG) stress testing, radionuclide examinations, and echocardiographic study.

PROVOCATIVE TESTING IN CARDIAC AUSCULTATION

Because of its wide availability and accuracy, echocardiography has largely supplanted the need to augment aus-

cultation of the heart by administration of the vasodilator amyl nitrate or the vasoconstrictors phenylephrine and methoxamine.¹⁻³

Amyl Nitrate

Administered by inhalation, amyl nitrate initially induces vasodilatation, a decrease in left ventricular size, and relative hypotension. These effects are followed by reflex tachycardia and an increase in cardiac output. The increased cardiac output augments the murmurs of valvular aortic stenosis, pulmonic stenosis, hypertrophic obstructive cardiomyopathy, and tricuspid regurgitation. Relative hypotension reduces the intensity of murmurs of mitral and aortic regurgitation, ventricular septal defect, and patent ductus arteriosus. The click and murmur of mitral valve prolapse occurs earlier because of reduction in mitral annular diameter, but like all mitral regurgitation murmurs, it is reduced in intensity.

Methoxamine and Phenylephrine

These agents are administered intravenously, with phenylephrine the preferred agent owing to its shorter duration of action. They are vasoconstrictors and affect murmurs by increasing arterial pressure, increasing heart size, and decreasing cardiac output. Increasing arterial pressure inten-

Comparative Approaches to Medical Reasoning Maurice E. Cohen, Donna L. Hudson, 1995 This book focuses on approaches to computer assisted medical decision making A unique feature of the book is that a specific problem in medical decision making has been selected from the literature with each contributed chapter presenting a different approach to the solution of the same problem Theoretical foundations for each approach are provided followed by practical application

Techniques include knowledge based reasoning neural network models hybrid systems reasoning with uncertainty and fuzzy logic among others The goal is to supply the reader with a variety of theoretical techniques whose practical implementation can be clearly understood through the example Using a single concrete example to illustrate different theoretical approaches allows various techniques to be easily contrasted and permits the reader to determine which aspects are pertinent to specific types of applications Although the methods are illustrated in a medical problem they have wide applicability in numerous areas of decision making
