Abstract. Stochastic counterparts of nonlinear dynamics are studied by means of nonperturbative functional methods developed in the framework of quantum field theory (QFT). In particular, we discuss fully developed turbulence, including leading corrections on possible compressibility of fluids, transport through porous media, theory of waterspouts and tsunami waves, stochastic magneto-hydrodynamics, turbulent transport in crossed fields, self-organized criticality, and dynamics of accelerated wrinkled flame fronts advancing in a wide canal. This report would be of interest to the broad auditorium of physicists and applied mathematicians, with a background in nonperturbative QFT methods or nonlinear dynamical systems, having an interest in both methodological developments and interdisciplinary applications.

1 Introduction

In this report, we study the stochastic counterparts of some models in nonlinear dynamics. Deterministic trajectories are replaced by random trial trajectories of some well-defined stochastic processes. The proposed approach is closely related to the Nelson stochastic mechanics, the probabilistic interpretation of dynamical equations, and the critical phenomena theory. We thoroughly use the renormalization group (RG) and the method of instanton—the nonperturbative techniques developed in the framework of quantum-field theory (QFT).

Asymptotic solutions for the models in stochastic dynamics are obtained in the form of a perturbation theory, which can be studied by means of Feynman functional integrals. In the presence of a large parameter in the model, this integral can be estimated directly—two examples are given in the fourth section. Otherwise, diagram series of the perturbation theory can sometimes be studied by means of RG techniques. We apply this method in the theory of turbulence, for the study of tsunami waves, in magneto-hydrodynamics (MHD), and in self-organized criticality.

In statistical mechanics, the RG (which is, in fact, a semigroup since the transformations are not invertible) forms an ensemble of transformations that map a Hamiltonian into another
