## Abstract

In this article, we consider Cauchy problem for the nonlinear parabolic-hyperbolic partial differential equations. These equations are solved by He-Laplace method.. It is shown that, in He-Laplace method, the nonlinear terms of differential equation can be easily handled by the use of He's polynomials and provides better results.

**Keywords:** Laplace transform method, Homotopy perturbation method, Partial differential equations, He's polynomials.

**AMS Subject classification:** 35G10; 35G15; 35G25; 35G30; 74S30.

## 1. Introduction

Nonlinearity exists everywhere and nature is nonlinear in general. The search for a better and easy to use tool for the solution of nonlinear equations that illuminate the nonlinear phenomena of real life problems of science and engineering has recently received a continuing interest. Various methods, therefore, were proposed to find approximate solutions of nonlinear equations. Some of the classical analytic methods are Lyapunov's artificial small parameter method [17], perturbation techniques [6,23,22, 25]. The Laplace decomposition method have been used to solve nonlinear differential equations [1-4, 16, 19, 20, 27]. J.H.He developed the homotopy perturbation method (HPM) [6-13,14-15,21,24,26] by merging the standard homotopy and perturbation for solving various physical problems. Furthermore, the homotopy perturbation method is also combined with the well-known Laplace transformation method [18] which is known as Laplace homotopy perturbation method.

In this paper, the main objective is to solve partial differential equations by using He-Laplace method. It is worth mentioning that He-Laplace method is an elegant combination of the Laplace transformation, the homotopy perturbation method and He's polynomials. The use of He's polynomials in the nonlinear term was first introduced by Ghorbani [5, 23]. This paper contains basic idea of homotopy perturbation method in section 2, He-Laplace method in section 3, examples in section 4 and conclusions in section 5 respectively.

## 2. Basic idea of homotopy perturbation method

Consider the following nonlinear differential equation

$$A(y) - f(r) = 0, \quad r \in \Omega \quad (1)$$

with the boundary conditions of

$$B\left(y, \frac{\partial y}{\partial n}\right) = 0, \quad r \in \Gamma, \quad (2)$$

where  $A$ ,  $B$ ,  $f(r)$  and  $\Gamma$  are a general differential operator, a boundary operator, a known analytic function and the boundary of the domain  $\Omega$ , respectively.

The operator  $A$  can generally be divided into a linear part  $L$  and a nonlinear part  $N$ . Eq. (1) may therefore be written as:

$$L(y) + N(y) - f(r) = 0, \quad (3)$$

By the homotopy technique, we construct a homotopy  $v(r, p) : \Omega \times [0, 1] \rightarrow \mathbb{R}$  which satisfies:

$$H(v, p) = (1 - p)[L(v) - L(y_0)] + p[A(v) - f(r)] = 0 \quad (4)$$

$$\text{or} \quad H(v, p) = L(v) - L(y_0) + p[L(y_0) + p[N(v) - f(r)]] = 0 \quad (5)$$

where  $p \in [0, 1]$  is an embedding parameter, while  $y_0$  is an initial approximation of Eq.(1), which satisfies the boundary conditions. Obviously, from Eqs.(4) and (5) we will have:
