Nonlinear and Stochastic Dynamics of Compliant Offshore Structures Seon Mi Han, Haym Benaroya, 2014-03-14 The purpose of this monograph is to show how a compliant offshore structure in an ocean environment can be modeled in two and three dimensions The monograph is divided into five parts Chapter 1 provides the engineering motivation for this work that is offshore structures These are very complex structures used for a variety of applications It is possible to use beam models to initially study their dynamics Chapter 2 is a review of variational methods and thus includes the topics principle of virtual work D'Alembert's principle Lagrange's equation Hamilton's principle and the extended Hamilton's principle These methods are used to derive the equations of motion throughout this monograph Chapter 3 is a review of existing transverse beam models They are the Euler Bernoulli Rayleigh shear and Timoshenko models The equations of motion are derived and solved analytically using the extended Hamilton's principle as outlined in Chapter 2 For engineering purposes the natural frequencies of the beam models are presented graphically as functions of normalized wave number and geometrical and physical parameters Beam models are useful as representations of complex structures In Chapter 4 a fluid force that is representative of those that act on offshore structures is formulated The environmental load due to ocean current and random waves is obtained using Morison's equation The random waves are formulated using the Pierson Moskowitz spectrum with the Airy linear wave theory

Dynamic Analysis of Non-Linear Structures by the Method of Statistical Quadraticization M.G. Donley, Pol Spanos, 2012-12-06 1 1 Introduction As offshore oil production moves into deeper water compliant structural systems are becoming increasingly important Examples of this type of structure are tension leg platforms TLP s guyed tower platforms compliant tower platforms and floating production systems The common feature of these systems which distinguishes them from conventional jacket platforms is that dynamic amplification is minimized by designing the surge and sway natural frequencies to be lower than the predominant frequencies of the wave spectrum Conventional jacket platforms on the other hand are designed to have high stiffness so that the natural frequencies are higher than the wave frequencies At deeper water depths however it becomes uneconomical to build a platform with high enough stiffness Thus the switch is made to the other side of the wave spectrum The low natural frequency of a compliant platform is achieved by designing systems which inherently have low stiffness Consequently the

maximum horizontal excursions of these systems can be quite large The low natural frequency characteristic of compliant systems creates new analytical challenges for engineers This is because geometric stiffness and hydrodynamic force nonlinearities can cause significant resonance responses in the surge and sway modes even though the natural frequencies of these modes are outside the wave spectrum frequencies High frequency resonance responses in other modes such as the pitch mode of a TLP are also possible *Nonlinear Dynamics and Chaos* J. M. T. Thompson,H. B. Stewart,2002-02-15
