Normal Testicular Descent and the Aetiology of Cryptorchidism John M. Hutson, Masaru Terada, Baiyun Zhou, Martyn P.L. Williams, 2011-10-08 **The Cryptorchid Testis** Thomas O. Abney, Brooks A. Keel, 2020-08-11 Current knowledge concerning both morphological and functional cryptorchid related alterations in the various testicular compartments is summarized in this valuable new publication Damage to the germinal epithelium and resulting infertility in both humans and experimental animals as well as the degree of damage to the different stages of germ cell development is discussed In addition information concerning hormonal therapy and orchidopexy to reverse cryptorchid related damage is provided Morphological alterations in Sertoli and Leydig cells is discussed in terms of cellular hypertrophy and hyperplasia alterations in organelle number and characteristics as well as changes in cell cell junctional complexes Changes in Sertoli cell and Leydig cell function including gonadotropin binding steroidogenesis and other metabolic alterations is also outlined as well as the influence of altered testicular function on subsequent hypothalamic pituitary changes Vascular disruption the potential role of paracrine substances and direct thermal damage all of which may be responsible for the resulting detrimental changes in one or more testicular compartments are considered **Cryptorchidism: Causes and Consequences** Richard Ivell, Julia Spencer Barthold, 2019-12-24 Cryptorchidism is the failure of one or both testes to descend into the scrotum at birth or shortly thereafter depending on species or the ascent of previously descended testes later in life It is the commonest of all congenital conditions in the human representing between 1 and 9% of all male babies born It is also common in domestic species such as pigs dogs and horses Importantly cryptorchidism is seen as a sentinel of fetal well being and is associated with other less common ailments such as testis cancer and hypospadias as part of the testicular dysgenesis syndrome TDS as well as being linked to maternal smoking and intrauterine growth restriction It also likely results from maternal exposure to endocrine disrupting chemicals Surprisingly we know relatively little about its immediate causes although deficits in fetal hormonal signaling through INSL3 or testosterone and complex genetic susceptibility seem to be involved The testes may be affected unilaterally or bilaterally with anatomical arrest anywhere between the abdomen to just above the scrotum Significantly we need to distinguish between the consequences of cryptorchidism simply due to retention of the testes within the body cavity at abdominal rather than scrotal temperature and those sequelae which share a common fetal cause The former are largely correctable by early orchidopexy In this Research Topic we aim to bring together a broad selection of articles reviews original research articles commentaries and hypotheses from the leading experts in the field discussing all aspects of this common congenital condition and throwing light on its genetic and environmental causes including its relationship to TDS and the biological mechanisms involved its sequelae and how these relate to optimal treatment Androgens and Androgen Receptor Chawnshang Chang, 2012-12-06 Androgen Receptors is the most comprehensive and up to date volume on the topic including discussions of the basic mechanisms of androgen androgen
