DISTILLATION OF PETROL

Petroleum distillation is a refining process that separates crude oil into its components, including petrol. It involves heating the crude oil in a fractionating column, where different hydrocarbons vaporize at varying temperatures. The vapors are then condensed into liquid fractions. Petrol, or gasoline, typically distills at a temperature range of 40–205°C (104–401°F). This process is crucial for obtaining various refined products from crude oil, meeting specific market demands.
