

GEOMETRICAL ASPECTS OF EXPANSIONS IN COMPLEX BASES

ANNA CHIARA LAI

ABSTRACT. We study the set of the representable numbers in base $q = pe^{\frac{2\pi i}{n}}$ with $p > 1$ and $n \in \mathbb{N}$ and with digits in a arbitrary finite real alphabet A . We give a geometrical description of the convex hull of the representable numbers in base q and alphabet A and an explicit characterization of its extremal points. A characterizing condition for the convexity of the set of representable numbers is also shown.

1. INTRODUCTION

In this paper we deal with expansions with digits in arbitrary alphabets and bases of the form $pe^{\frac{2\pi i}{n}}$ with $p > 1$ and $n \in \mathbb{N}$, namely we are interested in developments in power series of the form

$$(1) \quad \sum_{j=1}^{\infty} \frac{x_j}{q^j}$$

with the coefficients x_j belonging to a finite set of positive real values A named *alphabet* and the ratio $q = pe^{\frac{2\pi i}{n}}$, named *base*. The assumption $p > 1$ ensures the convergence of (1), being the base q greater than 1 in modulus. When a number x satisfies

$$x = \sum_{j=1}^{\infty} \frac{x_j}{q^j},$$

for a sequence $(x_j)_{j \geq 1}$ with digits in the alphabet A , we say that x is *representable* in base q and alphabet A and we call $(x_j)_{j \geq 1}$ a *representation* or *expansion* of x .

The first number systems in complex base seem to be those in base $2i$ with alphabet $\{0, 1, 2, 3\}$ and the one in base $-1 + i$ and alphabet $\{0, 1\}$, respectively introduced by Knuth in [11] and by Penney in [14]. After that many papers were devoted to representability with bases belonging to larger and larger classes of complex numbers, e.g. see [10] for the Gaussian integers in the form $-a \pm bi$ with $a \in \mathbb{N}$, [9] for the quadratic fields and [2] for the general case. Lovett and Kormarik pursued the work in [2] by introducing a greedy algorithm for the expansions in complex base with non rational argument [13]. In the eighties a parallel line of research was developed by Gilbert. In [5] he described the fractal nature of the set of the representable numbers, e.g. the set of representable in base $-1 + i$ with digits $\{0, 1\}$ coincides with the fascinating space-filling twin dragon curves [12]. Hausdorff dimension of some set of representable numbers was calculated in [6] and a weaker notion of self-similarity was introduced for the study of the

Sonochemistry and Sonoluminescence L.A. Crum, Timothy J. Mason, Jacques L. Reisse, Kenneth S. Suslick, 2013-11-11 Sonochemistry is studied primarily by chemists and sonoluminescence mainly by physicists but a single physical phenomenon acoustic cavitation unites the two areas The physics of cavitation bubble collapse is relatively well understood by acoustical physicists but remains practically unknown to the chemists By contrast the chemistry that gives rise to electromagnetic

emissions and the acceleration of chemical reactions is familiar to chemists but practically unknown to acoustical physicists. It is just this knowledge gap that the present volume addresses. The first section of the book addresses the fundamentals of cavitation leading to a more extensive discussion of the fundamentals of cavitation bubble dynamics in section two. A section on single bubble sonoluminescence follows. The two following sections address the new scientific discipline of sonochemistry and the volume concludes with a section giving detailed descriptions of the applications of sonochemistry. The mixture of tutorial lectures and detailed research articles means that the book can serve as an introduction as well as a comprehensive and detailed review of these two interesting and topical subjects.

How the Ray Gun Got Its Zap Stephen R.

Wilk, 2013-10-07. How the Ray Gun Got Its Zap is a collection of essays that discusses odd and unusual topics in optics. Though optics is a fairly specialized branch of physics, this book extracts from the discipline topics that are particularly interesting, mysterious, culturally relevant, or accessible. The essays all first appeared in abbreviated form in *Optics and Photonics News* and in *The Spectrograph*; the author has updated and expanded upon each of them for this book. The book is divided into three thematic sections: History, Weird Science, and Pop Culture. Chapters will discuss surprising uses of optics in classics and early astronomy, explain why we think of the sun as yellow when it is actually white, present how the laser is used in popular film, and profile the eccentric scientists who contributed to optics. The essays are short and entertaining and can be read in any order. The book should appeal to general audiences interested in optics or physics more generally, as well as members of the scientific community who are curious about optics phenomena.

Mohan M. Trivedi, 1990. *Selected Papers (1945-1980) Of Chen Ning Yang (With Commentary)* Chen Ning Yang, 2005-08-22. A remarkable personal and professional chronicle by one of today's leading physicists, this is a collection of Chen Ning Yang's personally selected papers supplemented by his insightful commentaries. Including previously unpublished or hard-to-find works, this volume contains Yang's important papers on statistical physics, nuclear forces, and particle physics. Among them are his seminal work with T. D. Lee on the nonconservation of parity for which they won the Nobel Prize, and his work with R. L. Mills which led to modern gauge theories with their exciting prospects for the broad unification of field theories. The commentaries were written especially for this volume and provide a fascinating account of Yang's development as a physicist, as well as a look at many important physicists of the 20th century. They trace the development of Yang's interests and ideas from his graduate school days to the present, showing how he worked with his colleagues and how their physics came into being. Together, the papers and commentaries in this unique collection comprise a powerful personal statement shedding light on both the intellectual development of a great physicist and on the nature of scientific inquiry.

Selected Topics in the Geometrical Study of Differential Equations Niky Kamran, 2002-01-01

The geometrical study of differential equations has a long and distinguished history dating back to the classical investigations of Sophus Lie, Gaston Darboux, and Elie Cartan. Currently, these ideas occupy a central position in several areas of pure and applied mathematics. In this book, the author

gives an overview of a number of significant ideas and results developed over the past decade in the geometrical study of differential equations Topics covered in the book include symmetries of differential equations and variational problems the variational bi complex and conservation laws geom
