

SEMANTICS

Semantics is the branch of linguistics that deals with studying meaning in language. It examines the meaning of words, phrases, sentences, and language.

OVERVIEW

Semantics looks at literal and implied meanings, the connotations words may carry, and how these meanings can change across different contexts. It also studies the relationships between words and phrases, like synonymy (words with the same or similar meanings), antonymy (words with opposite meanings), and polysemy (words or phrases with multiple, related meanings).

EXAMPLE

Interpreting Irony: Irony refers to when someone says one thing but means another, often conveying implied criticism or sarcasm. For example, if someone says, "What a great day!" while standing in pouring rain, this would be ironic because it implies disappointment with the current situation despite saying otherwise through their words.

Understand the cutting edge technology of semantic communications and its growing applications

Semantic communications constitute a revolution in wireless technology combining semantic theory with wireless communication

In a semantic communication essential information is encoded at the source drastically reducing the required data usage and then decoded at the destination in such a way that all key information is recovered even if transmission is damaged or incomplete

Enhancing the correspondence between background knowledge at source and destination can drive the data usage requirement even lower producing ultra efficient information exchanges with ultra low semantic ambiguity

Wireless Semantic Communications offers a comprehensive overview of this groundbreaking field its development and its future application

Beginning with an introduction to semantic communications and its foundational principles the book then proceeds to cover transceiver design and methods before discussing use cases and future developments

Semantics and Communication J. C. Condon, 1966

The Mathematical Theory of Semantic

Communication Kai Niu, Ping Zhang, 2025-05-31 This Open Access Book explores how classical information theory's focus on syntactic information has limited the further development of communication science Recently communication technologies that handle and transmit semantic information have gained widespread attention in academia Semantic communication has paved new directions for the future of communication technology development yet it lacks a general mathematical guiding theory To address this challenge this open access book constructs a theoretical framework for semantic information theory

and provides a systematic exposition of the measurement system for semantic information and the theoretical limits of semantic communication. It serves as a professional reference for researchers in information and communication. The book begins by deeply analyzing the data characteristics of various information sources and the needs of downstream tasks to summarize and generalize the universal attribute of semantic information synonymy and to define the synonymous mapping between semantic information and syntactic information. Stemming from this core concept, synonymous mapping, this book introduces the measures of semantic information. It then introduces a new mathematical tool, Synonymous Asymptotic Equipartition AEP, to explore the mathematical properties of synonymous typical sequences and applies random coding and synonymous typical sequence decoding encoding to prove the semantic lossless source coding theorem, semantic channel coding theorem, and semantic limited distortion source coding theorem. In addition, the semantic information measures in the continuous case are discussed, and a new channel capacity formula of the band-limited Gaussian channel is obtained, which is an important extension of the classical channel capacity. The book is a valuable resource for researchers, academics, and professionals in the field of information and communication, particularly those interested in advancing the frontiers of semantic communication technology.

Wireless Multimedia Computational Communications Xiaoming Tao, Yiping Duan, Zhijin Qin, Danlan Huang, Liting Wang, 2024-09-17. This book discusses the evolving designs and applications of multimedia content delivery and focuses on computing-based methods. It offers readers an in-depth understanding of how computational resources at both the source and the destination of the networking continuum can be exploited. This enhances the overall performance of multimedia data networking. This book also presents novel designs and applications focusing on information delivery based on computing. It starts with an overview of the multimedia computational communications as well as spanning topics. The topics range in experience evaluation using electroencephalography, semantic knowledge bases with the next generation of multiple access, end-to-end semantic communication framework, and cloud edge end intelligent coordination computing. The authors believe this book offers readers a clear picture of the current state and the next steps in multimedia computational communication networks. Graduate students majoring in the areas of communication networks, computer science, and engineering, and electrical engineering will find this book useful as a secondary text or reference book. Professionals and researchers working in computational transmission solutions for multimedia communication networks will find this book to be a valuable resource as well.

Modelling Autonomic Communication

Environments Rob Brennan, Joel Fleck II, Sven van der Meer, 2010-10-19

We are delighted to present the proceedings of the 5th International Workshop on Modeling Autonomic Communication

Environments MACE 2010 This workshop was held as part of the 6th International Conference on Network and Service Management CNSM 2010 formerly known as and building on the success of the MANWEEK conference series This year we met just a hundred yards away from Niagara Falls in Canada a very exciting location MACE started as an experiment and over the past years has created a small yet very active community that convened again this year to discuss and evaluate new advances innovative ideas and solid developments The main focus of MACE combining modeling with communications is certainly a hard topic that requires a lot of discussion thus the work presented at the workshop is intrinsically debatable and might not be as practiced as in other well established workshops but this was the nature of MACE from the beginning New ideas sometimes more sometimes less rough around the edges and some of them even inside are submitted and provoke extensive discussions The field in which we are working relies on these discussions or even adventures and we have this year again strongly motivated and supported a variety of novel work in the technical program This year the submissions while being closely related to the main themes brought some new areas into the workshop We still see architectural design and the application of autonomic principles to networks and services but we also now have submissions looking into previously unexplored areas such as Home Area Networks multimedia streaming virtualization federation and user experience This portrays a maturity in the domain which has by now gone through several cycles and improves its outputs by applying the lessons learned

Comparative Metric Semantics of Programming Languages Franck van Breughel, 2012-12-06 During the last three decades several different styles of semantics for programming languages have been developed This book compares two of

them the operational and the denotational approach On the basis of several examples we show how to define operational and denotational semantic models for programming languages Furthermore we introduce a general technique for comparing various semantic models for a given language We focus on different degrees of nondeterminism in programming languages Nondeterminism arises naturally in concurrent languages It is also an important concept in specification languages In the examples discussed the degree of nondeterminism ranges from a choice between two alternatives to a choice between a collection of alternatives indexed by a closed interval of the real numbers The former arises in a language with nondeterministic choices A real time language with dense choices gives rise to the latter We also consider the nondeterministic random assignment and parallel composition both couched in a simple language Besides nondeterminism our four example languages contain some form of recursion a key ingredient of programming languages

Organizations as Complex Systems Maurice Yolles, 2006-09-01 Managing the Complex is an ambitious title and it would be an audacious one if we were not to begin with a frank admission to date few to none of us have a skill set which includes managing the complex We try various things we write about others and we wonder about still others When a tool perspective or technique comes along which seems to evoke success we emulate it probe it and recoil at the all too often admission that it was situation and context which afforded success its opportunity and not some quality intrinsic to the tool perspective or technique Indeed if the study of complexity has done anything for managers and for those who espouse managerial theory it is in providing a scientific foundation for the notion that context matters Those who preach abstract ideas have then to reconcile themselves to the notion that situation and embodiment matters Those who believe in strong causality and determinism are left to wrestle with the role of chance uncertainty and chaos Those who prefer to argue that men move

history are confronted with the role of environment and affordances while those who argue the reverse are left to contend with charisma irrationality of crowds and the strange qualities we know as emotions A series on complex systems has less ambitious goals to contend with than this Such a series can deal with classifications and categories and speak of noise as if it were not the central focus of the problem Managing the complex is about managing noise or perhaps we should say it is about dealing with accepting making room for and learning from noise The articles in this volume and in volumes to come will each be considered as noise by some and as gems by others but we hope that practicing managers and academics alike will find plenty of fuel to drive their personal explorations into understanding and perhaps even managing the complex
