Examination was performed using a high-pitch 70 kV mode (NAEOTOM Alpha, Siemens Healthineers, Forchheim, Germany). **(1A)** Axial image at the level of the pulmonary valve demonstrates complete absence of the right ventricular outflow tract (arrow). **(1B)** Stereolithographic (STL) 3D model customized for surgical planning shows complex cardiovascular pathology (ventral view). **(1C)** The extracted major aortopulmonary collateral arteries (MAPCAs) surrounding the central tracheobronchial system (dorsal view).

2 MR angiography (MRA) of a 2-month-old girl¹ with partial anomalous pulmonary venous return (PAPVR). T1w f13d contrast-enhanced MRA was performed using a 1.5T scanner (MAGNETOM Sola Fit, Siemens Healthineers, Erlangen, Germany). **(2A)** Coronal multiplanar reformation (MPR) demonstrates anomalous flow of the left upper pulmonary vein (arrow) into the left brachiocephalic vein (arrowhead). **(2B)** An additional 3D volumetric reconstruction was performed using volume rendering technique (Cinematic VRT, symgo.via, Siemens Healthineers, Forchheim, Germany).

3 Pathologies of the thoracic aorta. **(3A)** MRA of a 6-year-old boy with aortic coarctation. T1w f13d contrast-enhanced MRA was performed using a 3T scanner (MAGNETOM Vida, Siemens Healthineers, Erlangen, Germany). Parasagittal maximum intensity projection (MIP) demonstrates collateralized high-grade narrowing of the aorta just distal to the origin of the left subclavian artery (arrow). **(3B)** 3D volumetric reconstruction (Cinematic VRT, symgo.via, Siemens Healthineers, Forchheim, Germany) derived from a T1w f13d contrast-enhanced MRA (1.5T, MAGNETOM Aera, Siemens Healthineers, Erlangen, Germany) in a 5-year-old girl with swallowing difficulties, showing a double aortic arch with persistence of both left and right aortic arch (arrows).

New Concepts In Cardiac Imaging 1985:

New Concepts in Cardiac Imaging, 1985 Gerald M. Pohost, Charles B. Higgins, Joel Morganroth, James Lewis Ritchie, Heinrich P. Schelbert, 1984-11 New Concepts in Cardiac Imaging, 1987 Noninvasive Imaging of Cardiac Metabolism Ernst E. van der Wall, 2012-12-06 F J Th WACKERS Metabolic imaging The future of cardiovascular nuclear imaging Since cardiovascular nuclear imaging emerged as a new subspecialty in the mid 1970s the field has gone through an explosive growth Radionuclide techniques became readily recognized as important new diagnostic aids in the armamentarium of the clinical cardiologist Initially cardiovascular nuclear imaging focused on static myocardial imaging using either thallium 201 or technetium 99m pyrophosphate for diagnosing acute myocardial infarction Shortly thereafter multigated equilibrium radionuclide angiocardiology became the most widely used noninvasive method for assessing cardiac function Furthermore attention and clinical application shifted towards the use of radionuclide techniques in conjunction with exercise testing either with thallium 201 myocardial perfusion imaging or technetium 99m left ventricular function studies The future of cardiovascular nuclear imaging appeared exciting and promising However around 1980 pessimists predicted the premature demise of cardiovascular nuclear imaging with the introduction of digital subtraction angiography and nuclear magnetic resonance imaging These doomsayers have been proven wrong in 1985 cardiovascular nuclear imaging is thriving and in many centers even expanding Although digital subtraction angiography and magnetic resonance imaging provided exquisite anatomic detail for practical evaluation of patients with ischemic heart disease in the Coronary Care Unit or exercise laboratory nuclear techniques appeared to be more practical **Progress in Digital Angiocardiology** P.H. Heintzen, J.H. Bürsch, 2012-12-06 According to Schopenhauer problems are usually passing through three stages in the first stage they are ignored or just smiled at in the second stage they are fought and in the third stage they are considered to be self evident just taken for granted Whereas digital subtraction angiography DSA has obviously reached stage three of that scale i.e. routine use in radiology digital angiocardiology in particular imaging the heart and coronary circulation is still on its way to the final goal the filmless heart catheterization laboratory for all invasive and interventional procedures A few pioneers have already completely abandoned the conventional cine coronary and angiographic technique others as we do still combine both digital and conventional methods in clinical routine but most cardiologists up till now stay sceptically aside We hope that at least some of the articles published in this volume may convince more and more cardiologists that digital imaging procedures are the method of choice in particular if quantitative assessment of the anatomical or functional status of the cardiovascular system is required pre and post operations or pre and post interventions Such a critical control of all therapeutic procedures be it by surgical catheter or medical interventions is indeed an urgent and widely underestimated or neglected requirement **Nuclear Cardiology and Cardiac Magnetic Resonance** Ernst E. van der Wall, 2012-12-06 Cardiovascular nuclear medicine emerged 15 years ago as a new noninvasive

technique for the detection of human cardiac disease It arised from the fields of nuclear medicine and cardiology and the cooperation of both specialties has been very productive At present nuclear cardiology techniques belong to the routine armamentarium of the clinical cardiologist Results obtained by perfusion markers metabolic tracers and radionuclide angiography have shown to have important impact on patient management Although exercise electrocardiography and echocar diography yield the large bulk of necessary data in the cardiac patient nuclear cardiology provides important data that go far beyond the results obtained by the standard procedures Magnetic resonance imaging is a relative newcomer in cardio logy and has still to prove its value in clinical cardiology Yet initial results have been encouraging both in congenital heart disease and in coronary artery disease This book is based on 16 review publications that have been written throughout the period of 1985 till present time Most chapters have been published in the period 1989 until 1991 the preceding review papers have been updated as much as possible Furthermore Chapter 15 entitled What s new in cardiac imaging has been espe cially written for this book The Chapters 9 11 and 13 have been recently written and have not been published yet

Elgazzar,2014-09-01 This book now in its third edition aims to promote a deeper understanding of the scientific and clinical basis of nuclear medicine and the new directions in medical imaging The new edition has been revised and updated to reflect recent changes and to ensure that the contents are in line with likely future directions The book starts by providing essential information on general pathophysiology cell structure and cell biology as well as the mechanisms of radiopharmaceutical localization in different tissues and cells The clinical applications of nuclear medicine are then presented in a series of chapters that cover every major organ system and relate the basic knowledge of anatomy physiology and pathology to the clinical utilization of various scintigraphic modalities The therapeutic applications of nuclear medicine are discussed in a separate chapter and the final chapter is devoted to the biologic effects of ionizing radiations including radiation from medical procedures

Cardiac Positron Emission Tomography Ernst E. van der Wall,P.K. Blanksma,M.G. Niemeyer,A.M. Paans,2012-12-06 Myocardial viability has become one of the most important issues in clinical cardiology In particular absence or presence of viability may be decisive in patient management and the decision to perform angioplasty PTCA or bypass surgery CABG is frequently based on the accurate assessment of viability Although echocardiography and conventional nuclear medicine techniques may provide valuable information on viability positron emission tomography PET is currently considered to be the gold standard for the assessment of myocardial viability The simultaneous evaluation of myocardial metabolism and perfusion allows precise delineation and accurate quantification of residual myocardial viability in affected regions In addition accurate quantification of myocardial perfusion alone may provide insight into the basic mechanisms of syndrome X and may assist in the appropriate clarification of this clinically complicated but frequently occurring phenomenon Besides that cardiac PET may deepen our insight into metabolism and perfusion of cardiac muscle disease particularly in hypertrophic cardiomyopathy Furthermore receptor imaging studies with PET will become important as the study of cardiac neurohumoral regulation in heart failure has gained in interest Cardiac Positron Emission Tomography Viability Perfusion Receptors and Cardiomyopathy describes the most recent developments in cardiac PET as these are related to myocardial viability and myocardial perfusion studies of syndrome X The value of PET for receptor imaging and cardiac muscle disease is also discussed For cardiologists nuclear medicine physicians radiochemists
