Beuvery, W.P. Zeijlemaker, J.B. Griffiths, 2012-12-06 Animal cell technology is a discipline of growing importance which aims not merely at understanding structure function and behaviour of differentiated animal cells but especially at the development of their abilities useful for clinical application Topics of interest in this regard include viral vaccines pharmaceutical proteins and novel applications such as gene therapy and organ culture Undoubtedly these Proceedings of the joint Meeting of the European Society for Animal Cell Technology and the Japanese Association for Animal Cell Technology Veldhoven The Netherlands September 1994 review the most recent status of the field and will be most valuable to anyone actively involved in the culture of animal cells and its applications The contributions to this volume were strictly selected on the basis of quality and novelty of contents Kluwer is honoured to be able to add this work to its strongly developing publication programme in cell and tissue culture which now has its connections to all major Societies in this field worldwide Audience Cell biologists biochemists molecular biologists immunologists virologists and all other disciplines related to animal cell technology working in an academic environment as well as in biotechnology or pharmaceutical industry Diagnostic and Therapeutic Antibodies Andrew J.T. George, Catherine E. Urch, 2008-02-02 Soon after the first description of monoclonal

antibodies in 1976 there was enormous interest in the clinical application of antibodies especially in the context of cancer. Antibodies appeared to offer the magic bullet that would allow the specific destruction of neoplastic cells. However many years effort resulted in very few cases of successful immunotherapy with antibodies. As a result there was a major backlash against antibody therapy and the field lost a considerable amount of popularity. Fashion in science as well as in other things tends to be cyclical. Antibody based therapy is once again attracting scientists and clinicians. There are several reasons for the renewed optimism. Certainly the experience of the last two decades has provided a wealth of information about problems associated with antibody therapy and possible solutions to these problems. Recombinant antibody engineering has rejuvenated the field allowing both the modification of antibodies to improve their in vivo properties and the isolation of novel antibody molecules by such techniques as phage display. The results of recent clinical trials have demonstrated unequivocally the benefit of antibody therapy in a number of settings and finally more careful consideration has been taken of the types of disease best treated using this approach.
