New Trends in Approximation Theory Javad Mashreghi, Myrto Manolaki, Paul Gauthier, 2018-03-28 The international conference entitled New Trends in Approximation Theory was held at the Fields Institute in Toronto from July 25 until July 29 2016 The conference was fondly dedicated to the memory of our unique friend and colleague Andr Boivin who gave tireless service in Canada until his very last moment of his life in October 2014 The impact of his warm personality and his fine work on Complex Approximation Theory was reflected by the mathematical excellence and the wide research range of the 37 participants In total there were 27 talks delivered by well established mathematicians and young researchers In particular 19 invited lectures were delivered by leading experts of the field from 8 different countries The wide variety of presentations composed a mosaic of aspects of approximation theory highlighting interesting connections with important contemporary areas of Analysis Primary topics discussed include application of approximation theory isoperimetric inequalities construction of entire order isomorphisms dynamical sampling approximation by harmonic and holomorphic functions especially uniform and tangential approximation polynomial and rational approximation zeros of approximants and zero free approximation tools used in approximation theory approximation on complex manifolds in product domains and in function spaces and boundary behaviour and universality properties of Taylor and Dirichlet series **Multivariate Approximation Theory** E. W. Cheney, 1986-01-01 The approximation of functions of several variables continues to be a difficult problem in scientific computing because many of the algorithms required for such problems have yet to be written This monograph is written for a broad audience of computational mathematicians and statisticians concerned with the development of algorithms or the derivation of approximations from linear projections of which the interpolating operators are an important example As an aid to both researchers and students a bibliography of more than 200 titles is included **New Developments in Approximation Theory** Manfred W. Müller, 1999 This book contains refereed papers which were presented at the Second International Dortmund Meeting on Approximation Theory IDoMAT 98 at Haus Bommerholz the conference center of Dortmund University during the week of February 23 27 1998 At this conference 50 researchers and specialists from Bulgaria China France Great Britain Hungary Israel Italy Romania South Africa and Germany participated and described new developments in the fields of univariate and multivariate approximation theory. The papers cover topics such as radial basis functions bivariate spline interpolation subdivision algorithms multilevel interpolation multivariate triangular Bernstein bases Pad approximation comonotone polynomial approximation weighted and unweighted polynomial approximation adaptive approximation approximation operators of binomial type quasi interpolants generalized convexity and Peano kernel techniques This research has applications in areas such as computer aided geometric design as applied in engineering and medical technology e g computerized tomography **Spherical Radial Basis Functions, Theory and Applications** Simon Hubbert, Quôc Thông Le Gia, Tanya M. Morton, 2015-05-13 This book is the first to be devoted to the theory and applications

of spherical radial basis functions SBFs which is rapidly emerging as one of the most promising techniques for solving problems where approximations are needed on the surface of a sphere The aim of the book is to provide enough theoretical and practical details for the reader to be able to implement the SBF methods to solve real world problems The authors stress the close connection between the theory of SBFs and that of the more well known family of radial basis functions RBFs which are well established tools for solving approximation theory problems on more general domains. The unique solvability of the SBF interpolation method for data fitting problems is established and an in depth investigation of its accuracy is provided Two chapters are devoted to partial differential equations PDEs One deals with the practical implementation of an SBF based solution to an elliptic PDE and another which describes an SBF approach for solving a parabolic time dependent PDE complete with error analysis The theory developed is illuminated with numerical experiments throughout Spherical Radial Basis Functions Theory and Applications will be of interest to graduate students and researchers in mathematics and related fields such as the geophysical sciences and statistics Groups, Modules, and Model Theory - Surveys and Recent **Developments** Manfred Droste, László Fuchs, Brendan Goldsmith, Lutz Strüngmann, 2017-06-02 This volume focuses on group theory and model theory with a particular emphasis on the interplay of the two areas The survey papers provide an overview of the developments across group module and model theory while the research papers present the most recent study in those same areas With introductory sections that make the topics easily accessible to students the papers in this volume will appeal to beginning graduate students and experienced researchers alike As a whole this book offers a cross section view of the areas in group module and model theory covering topics such as DP minimal groups Abelian groups countable 1 transitive trees and module approximations The papers in this book are the proceedings of the conference New Pathways between Group Theory and Model Theory which took place February 1 4 2016 in M lheim an der Ruhr Germany in honor of the editors colleague R diger G bel This publication is dedicated to Professor G bel who passed away in 2014 He was one of the leading experts in Abelian group theory Advancements in Complex Analysis Daniel Breaz, Michael Th. Rassias, 2020-05-12 The contributions to this volume are devoted to a discussion of state of the art research and treatment of problems of a wide spectrum of areas in complex analysis ranging from pure to applied and interdisciplinary mathematical research Topics covered include holomorphic approximation hypercomplex analysis special functions of complex variables automorphic groups zeros of the Riemann zeta function Gaussian multiplicative chaos non constant frequency decompositions minimal kernels one component inner functions power moment problems complex dynamics biholomorphic cryptosystems fermionic and bosonic operators. Buhmann, 2003-07-03 In many areas of mathematics science and engineering from computer graphics to inverse methods to signal processing it is necessary to estimate parameters usually multidimensional by approximation and interpolation Radial basis functions are a powerful tool which work well in very general circumstances and so are becoming of widespread use as the limitations of other methods such as least squares polynomial interpolation or wavelet based become apparent The author's aim is to give a thorough treatment from both the theoretical and practical implementation viewpoints For example he emphasises the many positive features of radial basis functions such as the

unique solvability of the interpolation problem the computation of interpolants their smoothness and convergence and provides a careful classification of the radial basis functions into types that have different convergence A comprehensive bibliography rounds off what will prove a very valuable work Free Boundary Problems Pierluigi Colli, Claudio Verdi, Augusto Visintin, 2012-12-06 Many phenomena of interest for applications are represented by differential equations which are defined in a domain whose boundary is a priori unknown and is accordingly named a free boundary A further quantitative condition is then provided in order to exclude indeterminacy Free boundary problems thus encompass a broad spectrum which is represented in this state of the art volume by a variety of contributions of researchers in mathematics and applied fields like physics biology and material sciences Special emphasis has been reserved for mathematical modelling and for the formulation of new problems Series and Products in the Development of Mathematics: Volume 1 Ranjan Rov, 2021-03-18 This is the first volume of a two volume work that traces the development of series and products from 1380 to 2000 by presenting and explaining the interconnected concepts and results of hundreds of unsung as well as celebrated mathematicians Some chapters deal with the work of primarily one mathematician on a pivotal topic and other chapters chronicle the progress over time of a given topic This updated second edition of Sources in the Development of Mathematics adds extensive context detail and primary source material with many sections rewritten to more clearly reveal the significance of key developments and arguments Volume 1 accessible to even advanced undergraduate students discusses the development of the methods in series and products that do not employ complex analytic methods or sophisticated machinery Volume 2 treats more recent work including deBranges solution of Bieberbach's conjecture and requires more advanced mathematical knowledge The Genesis of the Langlands Program Julia Mueller, Freydoon Shahidi, 2021-08-05 Robert Langlands formulated his celebrated conjectures initiating the Langlands Program at the age of 31 profoundly changing the landscape of mathematics Langlands recipient of the Abel Prize is famous for his insight in discovering links among seemingly dissimilar objects leading to astounding results This book is uniquely designed to serve a wide range of mathematicians and advanced students showcasing Langlands unique creativity and guiding readers through the areas of Langlands work that are generally regarded as technical and difficult to penetrate Part 1 features non technical personal reflections including Langlands own words describing how and why he was led to formulate his conjectures Part 2 includes survey articles of Langlands early work that led to his conjectures and centers on his principle of functoriality and foundational work on the Eisenstein series and is accessible to mathematicians from other fields Part 3 describes some of Langlands contributions to mathematical physics Handbook of Research on Modeling, Analysis, and Application of Nature-Inspired Metaheuristic Algorithms Dash, Sujata, Tripathy, B.K., Rahman, Atta ur, 2017-08-10 The digital age is ripe with emerging advances and applications in technological innovations Mimicking the structure of complex systems in nature can provide new ideas on how to organize mechanical and personal systems The Handbook of Research on Modeling Analysis
