Meta-evolution, the Future of Life David Hunter Tow, 2000 *The Future of Life: A Unified Theory of Evolution* David Hunter Tow, 2010-09-11 The Future of Life A Unified Theory of Evolution represents the first comprehensive formulation of the hypothesis that evolution is the unifying force underlying the dynamics of all processes in the universe both organic and inorganic In essence by combining information decision network and quantum theory it is demonstrated that an overarching evolutionary process shapes the spectrum of life and all phenomena in the universe beyond Darwin's original biological theory

The Future of Life: Meta-Evolution David Hunter Tow, 2006-10 The Future of Life Meta Evolution represents the first comprehensive formulation of the hypothesis that evolution is the unifying force underlying the dynamics of all processes in the universe both organic and inorganic These include all facets of human existence and civilisation the sciences technology arts humanities and religion In essence by applying quantum information network and decision theory it is demonstrated that an overarching evolutionary process shapes the spectrum of life and phenomena in the universe as a generic paradigm beyond Darwin's original biology based theory The Theory of Evolution is undoubtedly the most powerful paradigm ever conceived by humans to explain their own existence Since Darwin's epoch making treatise *Origin of Species* published in 1859 evolution has been centre stage universally recognised as the driving force in the emergence of modern humans from the genesis of life on this planet almost 4 billion years ago However despite its ubiquitous brilliance as the jewel in the crown of human intellectual achievement the notion of evolution has never been developed to its full potential It remains instead constrained within its biological cradle often reduced in everyday connotation to its lowest common denominator of survival of the fittest The intention of this book to re evaluate and expand the Darwinian model of evolution to demonstrate that its current application is only the tip of the intellectual iceberg and that by combining its formidable biological principles with those of decision complexity network quantum and information theory it emerges as an incalculably deeper and richer model than previously contemplated It will be demonstrated that the evolutionary engine which drives biological development also drives all other dynamic adaptive processes the physical social cognitive economic political and technological and is in fact the major dynamic governing the Universe past present and future It is further proposed to demonstrate that recent developments in artificial intelligence and ubiquitous computing through the Internet mark the next crucial stage in life's evolution involving the inevitable symbiosis of vast computational intelligence with the human mind The major hypothesis developed in this book of a global all encompassing Theory of Evolution coupled with its potential for realising the emancipation of human intelligence and potential provides a vastly more powerful paradigm for exploring the Future of Life than current scientific scenarios The resulting Omega state of infinite knowledge and wisdom which is proposed has been actively championed by a number of eminent 19th and 20th century philosophers such as Teilhard de Chardin Henri Bergson Schelling Alfred Whitehead Samuel Alexander and more recently by the leading physicist and futurist Professor Frank Tipler

However to date no equivalent scientific framework for supporting such a hypothesis has been provided In conclusion The Future of Life Meta Evolution has been written not as an academic text but as primarily a non technical review of the evidence to support such a hypothesis in much the same vein as other recent publications in the popular science philosophy genre It is hoped that this approach will therefore provide a window into the wider evolutionary debate for the general reader interested in one of the most critical emerging paradigm shifts of the 21st century

Evolution and Transitions in Complexity Gerard A.J.M Jagers op Akkerhuis,2016-10-18 This book discusses several recent theoretic advancements in interdisciplinary and transdisciplinary integration in the field of evolution While exploring novel views the text maintains a close link with one of the most broadly held views on evolution namely that of Darwinian evolution This work puts forth a new point of view which allows researchers to define in detail the concept of evolution To create this conceptual definition the text applies a stringent object based focus With this focus the editor has been able to develop an object based pattern of evolution at the smallest scale Subsequently this smallest scale pattern is used as an innovative basis for generalizations These generalizations create links between biological Darwinism and generalized Darwinism The object based approach that was used to suggest innovations in the field of Darwinian evolution also allowed for contributions to other topics such as major evolutionary transitions theory the definition of life and the relationships between evolution self organization and thermodynamics Together the chapters of this book and the multidisciplinary reflections and comments of various specialists on these chapters offer an exciting palette of innovative ideas

the darwin factor , **Metabolic Ecology** Richard M. Sibly,James H. Brown,Astrid Kodric-Brown,2012-04-30 One of the first textbooks in this emerging important field of ecology Most of ecology is about metabolism the ways that organisms use energy and materials The energy requirements of individuals their metabolic rates vary predictably with their body size and temperature Ecological interactions are exchanges of energy and materials between organisms and their environments So metabolic rate affects ecological processes at all levels individuals populations communities and ecosystems Each chapter focuses on a different process level of organization or kind of organism It lays a conceptual foundation and presents empirical examples Together the chapters provide an integrated framework that holds the promise for a unified theory of ecology The book is intended to be accessible to upper level undergraduate and graduate students but also of interest to senior scientists Its easy to read chapters and clear illustrations can be used in lecture and seminar courses Together they make for an authoritative treatment that will inspire future generations to study metabolic ecology
