

How to Design a Neural Network

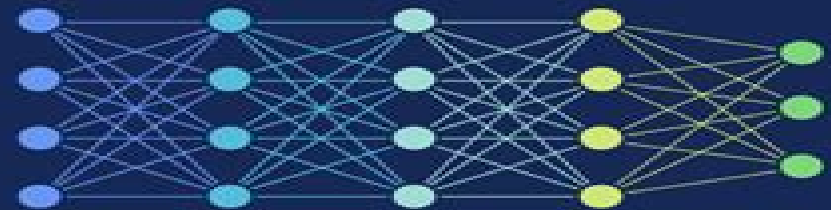

Neural networks pass an input, like an image, through multiple layers of digital neurons. Each layer reveals additional features of the input. Mathematicians are revealing how a network's architecture — how many neurons and layers it has and how they're connected — determines the kinds of tasks that the neural network will be good at.

When data is fed into a network, each artificial neuron that fires (labeled "1") transmits signals to certain neurons in the next layer, which are likely to fire if multiple signals are received. This process reveals abstract information about the input.

A **SHALLOW NETWORK** has few layers but many neurons per layer. These "expressive" networks are computationally intensive.

A **DEEP NETWORK** has many layers and relatively few neurons per layer. It can achieve high levels of abstraction using relatively few neurons.
