Abstract. Recent years have been ripe with discoveries of non-haemostatic platelet functions. This led to the appreciation of the significant, previously unknown, role played by the platelets in various pathologies and regenerative processes. As a result, exciting opportunities for clinical applications in fields as diverse as regenerative medicine and cancer treatment are emerging. However, their realization depends on the understanding of the regulatory mechanisms governing these diverse platelet functions, so that particular platelet responses could be artificially tailored to specific clinical situations. Current understanding of the signalling pathways controlling haemostatic responses is rooted in the development of quantitative assays for measuring them and sensitive markers for their quantification. However, the existing assays and markers are not sufficiently sensitive for distinguishing between individual signalling pathways and unravelling inter-pathway connections. Moreover, entirely new approaches are needed for studying non-haemostatic platelet functions, since there are currently no assays or markers for quantifying them. We review the on-going efforts in these directions, including our own recent work on using lectins as sensitive probes for profiling platelet activation.

1. Platelets and their therapeutic potential

Last decade in platelet research has been ripe with exciting surprises. Originally thought of as clotting factories (Fig. 1), platelets turned out to be involved in a wide variety of physiological and pathophysiological processes [75]. They appear to function as a Swiss army knife, unsheathed as a first-response to injury, in processes ranging from coagulation, where they limit traumatic blood loss, to inflammation and the subsequent steps of the wound healing cascade [5, 88, 97], angiogenesis [88, 96], vascular remodelling and maintenance of vascular integrity [35], *de novo* blood vessel synthesis, initial response to pathogens [148], and other aspects of both innate and adaptive immune response (Fig. 2) [88, 121, 138]. Misfiring of these mechanisms is implicated in pathological conditions as diverse as atherosclerosis [13, 67, 78, 110] and the development of cancer metastases [33, 34, 127]. This diversity raises important questions but also presents therapeutic opportunities that are as unique as they are varied. The realization of these opportunities is predicated on the understanding of the regulatory processes that govern platelets' various functional roles.

New Horizons In Platelet Activating Factor Research

New Horizons In Platelet Activating Factor Research:

New Horizons in Platelet Activating Factor Research C. M. Winslow, Mark L. Lee, 1987 Platelet Activating Factor PAF is a naturally occurring substance with potent biological effects which have a broad significant role in the activation of various inflammatory cells. It therefore contributes to a number of serious clinical conditions including anaphylaxis, allergic and inflammatory diseases, e.g. asthma, rhinitis, thrombosis. This book brings together leading investigators in the field to present their latest research directed towards the biosynthesis of PAF, its cellular origins, PAF-induced cellular and tissue responses, pathophysiological responses, and most important, to finding effective antagonistic drugs to control this inflammatory mediator.

Platelet-Activating Factor and Related Lipid Mediators F. Snyder, 2013-11-11 Platelet activating factor (PAF) is the commonly used name for a group of potent biologically active ether-linked phospholipids, the alkylacetyl-glycerophosphocholines. Following the identification of the chemical structure of PAF in 1979, much progress has been made in our understanding of these phospholipid mediators. This is particularly true from the points of view of their molecular structural requirements for expression of biological activity, their biosynthesis and catabolism, their diverse range of biological activities, evidence for their specific receptors at the cell surface, the development of specific antagonists for use in receptor studies, and for testing as potential anti-PAF drugs, and implications about their involvement in health and disease. Chapters in this book cover the current status of these general areas of PAF research. Although an enormous amount of information has been published about this interesting new type of phospholipid mediators, questions about their mechanism of action, regulatory controls, and the precise role and relative importance of PAF in specific diseases and physiological functions remain to be answered. Since the 1979 discovery, the PAF field has brought together scientists from a variety of different biomedical disciplines. The diversity of scientists now in PAF research is very apparent from the number of PAF publications appearing in a wide array of scientific journals, ranging from molecular biology to clinical medicine. Publications related to PAF continue to increase at an amazingly rapid rate, with the pace reminiscent of the period following the discovery of prostaglandins.

Molecular Mechanisms of Neuronal Responsiveness Yigal H. Ehrlich, Robert H. Lenox, Elizabeth Kornecki, William O. Berry, 2013-03-13 The interaction of neurotransmitters, neuromodulators, and neuroactive drugs with receptors localized at the cell surface initiates a chain of molecular events leading to integrated neuronal responses to the triggering stimuli. Major advancements in the characterization and isolation of receptor molecules have answered many questions regarding the nature of the elements that determine the specificity in these interactions. At the same time, recent studies have provided evidence that delicate regulation by intracellular enzymatic systems determines the efficiency of the stimulus-response coupling process. Mediation of the interaction between receptors operates in feedback control mechanisms and transduces signals from the receptors to various effector sites in a highly coordinated fashion. These studies are at the focus of the present volume, which is an outcome of a symposium held at the University of Vermont College.

of Medicine on March 21-23 1986 in conjunction with the seventeenth annual meeting of the American Society for Neurochemistry The symposium has demonstrated clearly that the concerted efforts of investigators in neurophysiology biochemistry pharmacology cell biology molecular genetics neurology and psychiatry are required to achieve better understanding of the processes underlying neuronal responsiveness This volume includes contributions provided by prominent investigators in all these research areas We hope that the readers will find here a useful source of information and ideas for stimulating further studies which may serve to narrow the gap between basic neuroscience research and its clinical implications

Lipid Mediators Fiona M. Cunningham, 2016-10-27 The Handbook of Immunopharmacology *Lipid Mediators* covers a comprehensive overview of lipid mediators from synthesis through to inhibition The book discusses the metabolism of arachidonic acid the measurement of fatty acids and their metabolites and the biological properties of cyclooxygenase products The text also describes other essential fatty acids their metabolites and cell-cell interactions the inhibitors of fatty acid derived mediators as well as the biosynthesis and catabolism of platelet activating factor The cellular sources of platelet activating factor and related lipids the biological properties of platelet activating factor and the effects of platelet activating factor receptor antagonists are also considered Immunopharmacologists immunologists and pharmacologists will find the book invaluable

Arachidonate Metabolism in Immunologic Systems L. Levine, 1988 *Aliphatic Compounds* Malcolm Sainsbury, 2016-06-24 Rodd's Chemistry of Carbon Compounds Volume I Aliphatic Compounds focuses on the chemistry of polyhydric alcohols and saccharides The chemistry of polyhydric alcohols is a vast and crucially important area not only because of the prominent roles that polyols have in their own right but because of the way they and their modified forms are incorporated into natural products The topics covered include the analogues derivatives and oxidation products of trihydric and tetrahydric alcohols phospholipids polyhydric alcohols and their oxidation products synthesis chemistry structure and physical properties and use in the synthesis as chiral templates and asymmetric synthesis of natural products of monosaccharides and disaccharides and oligosaccharides This text also discusses the applications of carbohydrates as chiral auxiliaries templates and starting materials in syntheses This volume is a useful reference for students and organic chemists

accumulation of as many as a hundred neuropeptides by the decade's end. In the 1980s the revolutions of molecular biology have been applied aggressively to the neurosciences with molecular cloning for neuropeptide precursors many important neurochemical enzymes and receptors for numerous transmitters

Demling, R. Fletcher, M. Foegh, 2012-12-06 *Biochemistry of Lipids, Lipoproteins and Membranes* J.E. Vance, Dennis E.

Vance, 1991-12-17 The second edition of this book on lipids lipoprotein and membrane biochemistry has two major objectives to provide an advanced textbook for students in these areas of biochemistry and to summarise the field for scientists pursuing research in these and related fields Since the first edition of this book was published in 1985 the emphasis on research in the area of lipid and membrane biochemistry has evolved in new directions Consequently this second edition has been modified to include four chapters on lipoproteins Moreover the other chapters have been extensively updated and revised so that additional material covering the areas of cell signalling by lipids the assembly of lipids and proteins into membranes and the increasing use of molecular biological techniques for research in the areas of lipid lipoprotein and membrane biochemistry have been included Each chapter of the textbook is written by an expert in the field but the chapters are not simply reviews of current literature Rather they are written as current readable summaries of these areas of research which should be readily understandable to students and researchers who have a basic knowledge of general biochemistry The authors were selected for their abilities both as researchers and as communicators In addition the editors have carefully coordinated the chapters so that there is little overlap yet extensive cross referencing among chapters
