Astronomical Photometry Eugene F. Milone, C. Sterken, 2011-04-06 This book will bring together experts in the field of astronomical photometry to discuss how their subfields provide the precision and accuracy in astronomical energy flux measurements that are needed to permit tests of astrophysical theories Differential photometers and photometry improvements in infrared precision the improvements in precision and accuracy of CCD photometry the absolute calibration of flux the development of the Johnson UBVRI photometric system and other passband systems to measure and precisely

classify specific types of stars and astrophysical quantities and the current capabilities of spectrophotometry and polarimetry to provide precise and accurate data will all be discussed in this volume The discussion of differential or two star photometers will include those developed for planetary as well as stellar photometry and will range from the Princeton polarizing photometer through the pioneering work of Walraven to the differential photometers designed to measure the ashen light of Venus and to counter the effects of aurorae at high latitude sites the last to be discussed will be the Rapid Alternate Detection System RADS developed at the University of Calgary in the 1980s

New Directions in Research with Third-Generation Soft X-Ray Synchrotron Radiation Sources A.S. Schlachter, F.J. Wuilleumier, 2012-12-06 Soft X rays are a powerful probe of matter They interact selectively with electrons in atoms and molecules and can be used to study atomic physics chemical reactions surfaces and solids and biological entities Over the past 20 years synchrotrons have emerged as powerful sources of soft X rays for experimental use A new third generation of synchrotron light sources is scheduled to start operation over the next few years beginning in 1993 These facilities are distinguished by their ultra low emittance electron beams and by their undulators precisely engineered magnetic devices that cause the electrons passing through them to produce highly coherent X rays and ultraviolet light of unprecedented spectral brightness This volume emphasizes third generation sources that produce light in the 10 eV 10 KeV energy range It describes potential applications ranging from the purely scientific to the commercially viable and includes chapters on the practical aspects of designing undulators and beam line optics Unique in its coverage the book is a vital addition to the library of any scientist who needs information on the world's most advanced imaging and spectroscopic techniques **ABSTRACT** This volume emphasizes the applications of new third generation synchrotron radiation sources that produce light in the ultraviolet and soft X ray range of the spectrum The unprecedented brightness of this light enables experiments to be conducted with greatly increased spatial and spectral resolution Scientists can exploit these properties for imaging and spectroscopic applications that until now were impossible or impractical Prominent researchers in the field describe these applications and others made possible by the light's pulsed time structure and polarization The volume also includes chapters on the practical aspects of designing undulators and beam line optics
