Remote Sensing And Geographical Information Systems In Epidemiology:

Remote Sensing and Geographical Information Systems in Epidemiology S.I. Hay, David James Rogers, Sarah E. Randolph, 2000-08-29 Global problems require global information which satellites can now provide With ever more sophisticated control methods being developed for infectious diseases our ability to map spatial and temporal variation in risk is more important than ever Only then may we plan control campaigns and deliver novel interventions and remedies where the need is greatest and sustainable success is most likely This book presents a comprehensive guide to using the very latest methods of surveillance from satellites including analysing spatial data within geographical information systems interpreting complex biological patterns and predicting risk both today and as it may change in the future Of all infectious disease systems those that involve free living invertebrate vectors or intermediate hosts are most susceptible to changing environmental conditions and have hitherto received most attention from the marriage of analytical biology with this new space technology Accordingly this volume presents detailed case studies on malaria African trypanosomiasis sleeping sickness tick borne infections and helminths worms For those who are unfamiliar with this science and unsure how to start the book ends with a chapter of practical advice on where to seek hands on instruction The lessons to be learned from these studies are applicable to many other epidemiological and ecological problems that face us today most significantly the preservation of the world s biodiversity Only book to provide a synthesis of complex biology quantitative analysis space technology and practical applications focused on solving real epidemiological problems on a global scale Broad scope with methods relevant to subjects ranging from biodiversity to public health Practical advice on relevant courses 24 pages of colour plates

Biology of Disease Vectors William H. Marquardt, 2004-12-04 Biology of Disease Vectors presents a comprehensive and advanced discussion of disease vectors and what the future may hold for their control This edition examines the control of disease vectors through topics such as general biological requirements of vectors epidemiology physiology and molecular biology genetics principles of control and insecticide resistance Methods of maintaining vectors in the laboratory are also described in detail No other single volume includes both basic information on vectors as well as chapters on cutting edge topics authored by the leading experts in the field The first edition of Biology of Disease Vectors was a landmark text and this edition promises to have even more impact as a reference for current thought and techniques in vector biology Current each

chapter represents the present state of knowledge in the subject area. Authoritative authors include leading researchers in the field. Complete provides both independent investigator and the student with a single reference volume which adopts an explicitly evolutionary viewpoint throughout all chapters. Useful conceptual frameworks for all subject areas include crucial information needed for application to difficult problems of controlling vector borne diseases. *Geospatial Technologies in Environmental Management* Nancy Hoalst-Pullen, Mark W. Patterson, 2010-09-27. Geotechnologies and the Environment: Environmental Applications and Management presents an engaging and diverse array of physically oriented GIScience applications that have been organized using four broad themes. While the book's themes are by no means mutually exclusive, Hoalst-Pullen and Patterson provide an elegant overview of the field that frames the collection's subsequent thematic structure: Wilderness and Wildlife Response, Glaciers, Wetlands and Watersheds, and Human Health and the Environment. Over the course of the volume, the contributing authors move beyond basic and in some respects clichéd landscape ecology of land use change to explore human environment dynamics heretofore not emphasized in the applied literature. In doing so, the collection presents a compelling case for the importance of developing new physically oriented GIScience applications that reside at the nexus of social and natural systems with the explicit intent of informing public policy and/or the decision making practices of resource managers. Individually, the chapters themselves are intentionally diverse. The diversity of the approaches, their spatial context, and emphases on management applications demonstrate the many ways in which geotechnologies can be used to address small and big problems in both developed and developing regions. The collection's internal coherence is derived like the book series from its explicit appeal to a wide variety of human environment interactions with potential policy linkages.
