Consequently any effort in the area of sustainability involves concepts principles and methods from engineering the social sciences including economics and social psychology the biological sciences including ecology and the physical sciences Sustainability Multi Disciplinary Perspectives discusses multidisciplinary aspects of the salient concepts principles and methods relevant to sustainability in a coherent and comprehensive manner Topics covered range from green engineering and sustainability metrics to infrastructure and environmental policy *Collaborative Environmental Governance*

Frameworks Timothy Gieseke,2019-08-06 This book takes a practical approach to understanding and describing collaborative governance for resolving environmental problems It introduces a new collaborative governance assessment model and recognizes that collaborations are a natural result of organizations converging around complex issues Rather than identifying actors by their type of organization the actors are identified by the type of role they play This approach is aligned with how individuals and organizations interact in practice and their dependance on collaborations to solve emerging environmental problems The book discusses real cases with governance issues and creates new frameworks for collaborations Features Addresses communities at all levels and scales that are gravitating toward collaborations to solve their environmental issues Prepares and enables individuals to participate in collaborative governance and design collaborative governance frameworks Introduces the first simplified and standardized model to assess governance using governance actors and styles Explains governance in simple terms and builds governance frameworks from the individual s perspective the smallest viable unit of governance in a collaboration Describes tools of convergence for collaborative leaders to organize and align activities to create shared governance outcomes and outputs Gamification for Resilience Adrian V. Systems Science and Cybernetics - Volume II Francisco Parra-Luna, 2009-10-30 The subject Systems sciences and cybernetics is the outcome of the convergence of a number of trends in a larger current of thought devoted to the growing complexity of primarily social objects and arising in response to the need for globalized treatment of such objects This has been magnified by the proliferation and publication of all manner of quantitative scientific data on such objects advances in the theories on their inter relations the enormous computational capacity provided by IT hardware and software and the critical revisiting of subject object interaction not to mention the urgent need to control the efficiency of complex systems where efficiency is understood to mean the ability to find a solution to many social problems including those posed on a planetary scale The

result has been the forging of a new academically consolidated scientific trend going by the name of Systems Theory and Cybernetics with a comprehensive multi disciplinary focus and therefore apt for understanding realities still regarded to be inescapably chaotic This subject entry is subdivided into four sections The first an introduction to systemic theories addresses the historic development of the most commonly used systemic approaches from new concepts such as the so called geometry of thinking or the systemic treatment of non systemic identities to the taxonomic entropic axiological and ethical problems deriving from a general systemic cybernetic conceit Hence the focus in this section is on the historic and philosophical aspects of the subject Moreover it may be asserted today that beyond a shadow of a doubt problems in particular problems deriving from human interaction but in general any problem regardless of its nature must be posed from a systemic perspective for otherwise the obstacles to their solution are insurmountable Reaching such a perspective requires taking at least the following well known steps a statement of the problem from the determinant variables or phenomena b adoption of theoretical models showing the interrelationships among such variables c use of the maximum amount of wherever possible quantitative information available on each d placement of the set of variables in an environment that inevitably pre determines the problem That epistemology would explain the substantial development of the systemic cybernetic approach in recent decades The articles in the second section deal in particular with the different methodological approaches developed when confronting real problems from issues that affect humanity as a whole to minor but specific questions arising in human organizations Certain sub themes are discussed by the various authors always from a didactic vantage including problem discovery and diagnosis and development of the respective critical theory the design of ad hoc strategies and methodologies the implementation of both qualitative soft system methodologies and formal and quantitative such as the General System Problem Solver or the axiological operational perspective approaches cross disciplinary integration and suitable methods for broaching psychological cultural and socio political dynamisms The third section is devoted to cybernetics in the present dual meaning of the term on the one hand control of the effectiveness of communication and actions and on the other the processes of self production of knowledge through reflection and the relationship between the observing subject and the observed object when the latter is also observer and the former observed Known as second order cybernetics this provides an avenue for rethinking the validity of knowledge such as for instance when viewed through what is known as bipolar feedback processes through which interactions create novelty complexity and diversity Finally the fourth section centres around artificial and computational intelligence addressing sub themes such as neural networks the simulated annealing that ranges from statistical thermodynamics to combinatory problem solving such as in the explanation of the role of adaptive systems or when discussing the relationship between biological and computational intelligence
