Neural Network Design And The Complexity Of Learning:

Neural Network Design and the Complexity of Learning J. Stephen Judd, 1990 Using the tools of complexity theory Stephen Judd develops a formal description of associative learning in connectionist networks He rigorously exposes the computational difficulties in training neural networks and explores how certain design principles will or will not make the problems easier Judd looks beyond the scope of any one particular learning rule at a level above the details of neurons There he finds new issues that arise when great numbers of neurons are employed and he offers fresh insights into design principles that could guide the construction of artificial and biological neural networks The first part of the book describes the motivations and goals of the study and relates them to current scientific theory It provides an overview of the major ideas formulates the general learning problem with an eye to the computational complexity of the task reviews current theory on learning relates the book's model of learning to other models outside the connectionist paradigm and sets out to examine scale up issues in connectionist learning Later chapters prove the intractability of the general case of memorizing in networks elaborate on implications of this intractability and point out several corollaries applying to various special subcases Judd refines the distinctive characteristics of the difficulties with families of shallow networks addresses concerns about the ability of neural networks to generalize and summarizes the results implications and possible extensions of the work *Neural Network Design and the Complexity of Learning* is included in the *Network Modeling and Connectionism* series edited by Jeffrey Elman

Handbook of Approximation Algorithms and Metaheuristics Teofilo F. Gonzalez, 2007-05-15. Delineating the tremendous growth in this area, the *Handbook of Approximation Algorithms and Metaheuristics* covers fundamental theoretical topics as well as advanced practical applications. It is the first book to comprehensively study both approximation algorithms and metaheuristics. Starting with basic approaches, the handbook presents the methodologies to design and analyze efficient approximation algorithms for a large class of problems and to establish inapproximability results for another class of problems. It also discusses local search, neural networks, and metaheuristics as well as multiobjective problems, sensitivity analysis, and stability. After laying this foundation, the book applies the methodologies to classical problems in combinatorial optimization, computational geometry, and graph problems. In addition, it explores large-scale and emerging applications in networks, bioinformatics, VLSI, game theory, and data analysis. Undoubtedly sparking further developments in the field, this handbook provides the essential techniques to apply approximation algorithms and metaheuristics to a wide range of problems in computer science, operations research, computer engineering, and economics. Armed with this information, researchers can design and analyze efficient algorithms to generate near-optimal solutions for a wide range of computational intractable problems.

Machine Learning: From Theory to Applications Stephen J. Hanson, Werner Remmele, Ronald L. Rivest, 1993-03-30. This volume includes some of the key research papers in the area of machine learning produced at MIT and Siemens during a three-year joint research effort. It includes papers on many different styles of machine learning organized into three parts. Part I: theory includes three papers on theoretical aspects of machine learning. The first two use the theory of computational complexity to derive some fundamental limits on what is efficiently learnable. The third provides an efficient algorithm for identifying finite automata. Part II: artificial intelligence and symbolic learning methods includes five papers giving an overview of the state of the art and future developments in the field of machine learning, a subfield of artificial intelligence dealing with automated knowledge acquisition and knowledge revision. Part III: neural and collective computation includes five papers sampling the theoretical diversity and trends in the vigorous new research field of neural networks, massively parallel symbolic induction, task decomposition through competition, phoneme discrimination, behavior-based learning, and self-repairing neural networks.
