Neural Mechanisms And Cardiovascular Disease Fidia Research Series Vol 5:

Pathophysiology and Rational Pharmacotherapy of Myocardial Ischemia G. Heusch, 2013-06-29 Ischemic heart disease is still the most frequent cause of death in the western world. There have been significant achievements in diagnostic procedures as well as in the medical invasive and surgical treatment of ischemic heart disease in recent years. A variety of drugs are available for the pharmacotherapy of ischemic heart disease particularly nitrates, blockers and calcium antagonists which are used as monotherapy or in various combinations. However, the selection of patients for a certain treatment as well as the optimization of an individual treatment are still largely empirical. On the other hand, the recent advances in experimental cardiology emphasize the extremely complex and dynamic scenario of ischemic heart disease involving endothelial damage, coagulation processes, metabolic and morphological derangements, coronary constrictor mechanisms, blood flow redistribution, arrhythmogenesis, contractile dysfunction during ischemia and reperfusion and finally lack or presence of pain perception. Therefore, it appears desirable to close the gap between experimental and clinical cardiology and thus to provide a pathophysiological basis for rational clinical decisions with respect to diagnostic and therapeutic procedures. The idea for this book arose during the preparation of a seminar series on experimental cardiology when I found it difficult to collect the pertinent information from textbooks of cardiology, physiology, pathology and pharmacology as well as from numerous review and original articles on specific topics. I am now very grateful that expert clinical and experimental colleagues from around the world have joined me in the effort to provide a comprehensive textbook on the pathophysiology of myocardial ischemia and its rational pharmacotherapy.

Heart-Brain Interactions Giuseppe Di Pasquale, Giuseppe Pinelli, 2012-12-06 In the last decade there has been a growing interest in the study of the interactions between the heart and the brain, especially in the field of cerebral ischemia. The interactions between cardiovascular and cerebrovascular diseases are of relevance not only for research investigation but also for clinical implications in the daily clinical practice. A wealth of information has been gathered particularly on three topics: cardiovascular consequences of cerebral injuries, cardioembolic stroke and association of carotid and coronary artery disease. The available information, however, is still sparse and fragmentary, mainly because of the lack of communication between neurologists and cardiologists. With the aim of improving communication between several disciplines and technologies, we started to organize since 1987 in Bologna, Italy, an international Symposium on heart-brain interactions to be held every 3 years. Our intention was to gather prominent clinicians and researchers from outstanding cardiological and neurological institutions actively involved in the study of heart-brain interactions. The ambitious goal has been to fit different pieces of information like in a puzzle. This book originates from the contributions presented at the 2nd Symposium which was held in Bologna on November 30-December 1, 1990. The book is subdivided into three sections: I cardiovascular consequences of cerebral damage, II cardiogenic cerebral ischemia, III cerebrovascular and coronary artery disease.

Temporal Variations of the Cardiovascular System Thomas F.H. Schmidt, Bernard T. Engel, Gerhard

Blümchen,2013-04-18 Although it is widely recognized that there are significant variations in the circulation throughout the 24 hour day these patterns have often been conceived as nuisance variables rather than functional differences Responses of the circulation are examined here not as stable phenomena but as integrated functions highly sensitive to environmental conditions and driven by internal and external pacesetters In this volume cardiologists with a primary interest in hypertension or heart disease chronobiologists and psychologists join together for the first time to give the reader the opportunity to learn the extent and clinical significance of these changes from a chronobiological behavioral and physiological perspective National Library of Medicine Current Catalog National Library of Medicine (U.S.),1986

Reflex Control of the Circulation Irving H. Zucker,Joseph P. Gilmore,2020-02-03 Reflex Control of the Circulation presents an interdisciplinary discussion of concepts in the reflex control of circulation This volume describes aspects of autonomic receptor physiology central pathways of reflex control the electrophysiology of cardiovascular afferents the interaction between reflexes the autonomic control of regional blood flows the autonomic control of fluid and electrolyte balance and neurohumoral control of the circulation through normal and pathological states e g hypertension congestive heart failure In addition the regulation of regional blood flow during exercise and developmental aspects of reflex control are examined Any researcher interested in the autonomic system and its role in circulation will find this book fascinating reading

Current Catalog National Library of Medicine (U.S.), First multi year cumulation covers six years 1965 70 The Heart in Hypertension Michel Emile Safar,F. Fouad-Tarazi,2012-12-06 Hypertension is the major cause of left ventricular hypertrophy While the electrocardiogram is an extremely insensitive measure of anatomic left ventricular hypertrophy it provides a time tested important marker of an adverse cardiovascular outcome There has been a recent temporal decrease in the incidence of electrocardiographic evidence of LVH even within the hypertensive population no doubt this is the result of large antihypertensive treatment experts Anatomical evidence of left ventricular hypertrophy is best documented pre morbidly using echocardiographic techniques It therefore appears that between 20 and 50 percent of the hypertensive population has left ventricular hypertrophy by echocardiographic techniques The prognostic significance of the echocardiographically determined increase in left ventricular mass is just beginning to be evaluated Early information suggests that there is an increased rate of cardiovascular morbidity in patients with echocardiographic evidence of increased left ventricular mass However this information is only preliminary and as yet only a limited number of events have been reported Far more supporting information will be required before the full impact of echocardiographically detected left ventricular hypertrophy can be determined Nevertheless it must be stated that the electrocardiogram still has the greatest predictive value of cardiovascular morbid and mortal events when the pattern of left ventricular hypertrophy plus repolarization abnormalities are present Publications University of Iowa.
