Long Term Durability of Structural Materials P.J.M. Monteiro,K.P. Chong,J. Larsen-Basse,K.

Komvopoulos,2001-08-29 Long Term Durability of Structural Materials features proceedings of the workshop held at Berkeley CA in October 2000 It brought together engineers and scientists who have received grants from the initiative NSF 98 42 to share their results on the study of long term durability of materials and structures The major objective was to develop new methods for accelerated short term laboratory or in situ tests which allow accurate reliable predictions of the long term performance of materials machines and structures To achieve this goal it was important to understand the fundamental nature of the deterioration and damage processes in materials and to develop innovative ways to model the behavior of these processes as they affect the life and long term performance of components machines and structures The researchers discussed their approach to include size effects in scaling up from laboratory specimens to actual structures Accelerated testing and durability modeling techniques developed were validated by comparing their results with performance under actual operating conditions The main mechanism of the deterioration discussed included environmental effects and or exposure to loads speeds and other operating conditions that are not fully anticipated in the original design A broad range of deterioration damage such as fatigue overload ultraviolet damage corrosion and wear was presented A broad range of materials of interest was also discussed including the full spectrum of construction materials metals ceramics polymers composites and coatings Emphasis was placed on scale dependence and history of fabrication on resulting mechanical behavior of materials

Sustainability in Structural Concrete Design Jorge de Brito,Rui Vasco Silva,2024-05-06 Sustainability in construction is a priority for both academia and industry to reduce the carbon footprint of the built environment and thus combat climate change Numerous approaches have been developed on how to tackle this issue wherein the implementation of eco ef cient

concrete is currently considered one of the most effective measures to be applied at the beginning of a building's life cycle. This edition of the Structural Engineering Document discusses key issues in selecting and incorporating eco-efficient waste materials capable of enhancing the sustainability of structural concrete in construction projects. The cost efficiency of using recycled aggregates in structural concrete is shown by several world renowned researchers. Critical evaluations and case studies further highlight the properties and performance of these materials and in various structural applications. Also novel low impact binding systems using industrial by products showcase the importance of continuous research for technically viable alternatives capable of decreasing the huge dependency on ordinary Portland cement. The purpose of this document is to contribute to a broader understanding of the many possibilities for the development of a more sustainable structural concrete thereby fostering resilient and sustainable construction practices to support the global commitment to environmental responsibility.

Environment-Friendly Construction Materials Shaopeng Wu, Inge Hoff, Serji Amirkhanian, Yue Xiao, 2019-06-20 Construction materials are the most widely used materials for civil infrastructure in our daily lives. However from an environmental point of view they consume a huge amount of natural resources and generate the majority of greenhouse gasses. Therefore many new and novel technologies for designing environmentally friendly construction materials have been developed recently. This Special Issue Environment Friendly Construction Materials has been proposed and organized as a means to present recent developments in the field of construction materials. It covers a wide range of selected topics on construction materials.

High-performance Construction Materials Caijun Shi, 2008 This book describes a number of high performance construction materials including concrete steel fiber reinforced cement fiber reinforced plastics polymeric materials geosynthetics masonry materials and coatings. It discusses the scientific bases for the manufacture and use of these high performance materials. Testing and application examples are also included in particular the application of relatively new high performance construction materials to design practice. Most books dealing with construction materials typically address traditional materials only rather than high performance materials and as a consequence do not satisfy the increasing demands of today's society. On the other hand books dealing with materials science are not engineering oriented with limited coverage of the application to engineering practice. This book is thus unique in reflecting the great advances made on high performance construction materials in recent years. This book is appropriate for use as a textbook for courses in engineering materials structural materials and civil engineering materials at

the senior undergraduate and graduate levels It is also suitable for use by practice engineers including construction materials mechanical and civil engineers
