Longevity and Causes of Mortality in Elite Athletes Juliana Antero-Jacquemin, Université Paris Descartes (1970-2019).,2015 Background and objectives along their careers elite athletes are subjected to specific constraints that distinguish them from the general population Such constraints related to the high intensity of their physical activity their overexposure to injuries or particular lifestyle may have long term consequences on the athletes health and ultimately on their longevity Thus the main goals of the present study are the following 1 to describe and analyze elite athletes longevity and specific causes of mortality in comparison with the general population and according to the type of effort they performed and 2 to investigate their lifespan trends in comparison with the longest lived humans in order to apprehend the current scenario of human longevity trends Methods we collected data on the biography and the

athletic performances of all the French athletes who participated in the Olympic Games OG from 1912 to 2012 n 4708 and all the French cyclists who participated in the Tour de France TDF from 1947 to 2012 n 786 Then we verified their vital statuses through the National Registry of Identification of Physical Persons RNIPP For the deceased athletes we obtained the causes of their deaths through the Centre for epidemiology on medical causes of death C piDc We compared the athletes overall and specific mortality according to the main chapters of the International Classification of Disease with the French civilian life tables using Standardized Mortality Ratio SMR and the Kaplan Meier methods We adapted and applied the life years lost method under the competing risk model to quantify differences on longevity due to major causes of death according to the athletes type of effort Furthermore we collected data on worldwide deceased Olympians participating in the OG from 1896 to 2012 n 19 012 and on worldwide supercentenarians 110 years deceased between 1900 and 2013 n 1 205 in order to analyze their lifespan trends using a density analysis tool total number of life durations per birth date Findings and conclusion French elite athletes show consistently lower mortality 40 50% lower in comparison with their compatriots whether female or male Olympians or professional cyclists mostly related with a lower cardiovascular 40 60% lower and cancer mortality 45% lower No excess mortality was observed in elite athletes for any of the specific causes of death we studied French Olympians lower mortality results in an average of seven years of life saved in relation to the general population This gain partitioned according to specific causes of deaths shows that cardiovascular longevity benefit is associated with the type of sports practiced during the Olympic career favoring combined type of effort over very short or very long duration effort In relation to cancer mortality all types of effort studied were associated with better longevity Despite their survival advantage no Olympian in the world up to date has ever reached the status of a supercentenarian as the longest lived was 106 years old The common lifespan trends between Olympians and supercentenarians indicate similar mortality pressures over both populations that increase with age a scenario that is better explained by a biological barrier limiting further progression The supercentenarians density trends show a current stagnation of the human longevity
