Neutron Star:

Theory of Neutron Star Magnetospheres F. Curtis Michel, 1991 An incomparable reference for astrophysicists studying pulsars and other kinds of neutron stars Theory of Neutron Star Magnetospheres sums up two decades of astrophysical research It provides in one volume the most important findings to date on this topic essential to astrophysicists faced with a huge and widely scattered literature F Curtis Michel who was among the first theorists to propose a neutron star model for radio pulsars analyzes competing models of pulsars radio emission models winds and jets from pulsars pulsating X ray sources gamma ray burst sources and other neutron star driven phenomena Although the book places primary emphasis on theoretical essentials it also provides a considerable introduction to the observational data and its organization Michel emphasizes the problems and uncertainties that have arisen in the research as well as the considerable progress that has been made to date

Neutron Stars and Pulsars Werner Becker, 2009-02-11 Neutron stars are the most compact astronomical objects in the universe which are accessible by direct observation Studying neutron stars means studying physics in regimes unattainable in any terrestrial laboratory Understanding their observed complex phenomena requires a wide range of scientific disciplines including the nuclear and condensed matter physics of very dense matter in neutron star interiors plasma physics and quantum electrodynamics of magnetospheres and the relativistic magneto hydrodynamics of electron positron pulsar winds interacting with some ambient medium Not to mention the test bed neutron stars provide for general relativity theories and their importance as potential sources of gravitational waves It is this variety of disciplines which among others makes neutron star research so fascinating not only for those who have been working in the field for many years but also for students and young scientists The aim of this book is to serve as a reference work which not only reviews the progress made since the early days of pulsar astronomy but especially focuses on questions such as What have we learned about the subject and how did we learn it What are the most important open questions in this area and What new tools telescopes observations and calculations are needed to answer these questions All authors who have contributed to this book have devoted a significant part of their scientific careers to exploring the nature of neutron stars and understanding pulsars Everyone has paid special attention to writing educational comprehensive review articles with the needs of beginners students and young scientists as potential readers in mind This book will be a valuable source of information for these groups

Supernovae, Neutron Star Physics and Nucleosynthesis Debades Bandyopadhyay, Kamales Kar, 2022-03-28 This book deals with the interdisciplinary areas of nuclear physics supernovae and neutron star physics It addresses the physics and astrophysics of the spectacular supernova explosions starting with the collapse of massive stars and ending with the birth of neutron stars or black holes Recent progress in the understanding of core collapse supernova CCSN and observational aspects of future detections of neutrinos from CCSN explosions are discussed The other main focus in this text is the novel phases of dense nuclear matter its compositions and equation of state EoS from low to very high baryon density relevant to

supernovae and neutron stars The multi messenger astrophysics of binary neutron star merger GW170817 and its relation to EoS through tidal deformability are also presented in detail The synthesis of elements heavier than iron in the supernova and neutron star environment by the rapid r process are treated here with special emphasis on the nucleosynthesis in the ejected material from GW170817 This monograph is written for graduate students and researchers in the field of nuclear astrophysics

The Physics and Astrophysics of Neutron Stars Luciano Rezzolla, Pierre Pizzochero, David Ian Jones, Nanda Rea, Isaac Vidaña, 2019-01-09 This book summarizes the recent progress in the physics and astrophysics of neutron stars and most importantly it identifies and develops effective strategies to explore both theoretically and observationally the many remaining open questions in the field Because of its significance in the solution of many fundamental questions in nuclear physics astrophysics and gravitational physics the study of neutron stars has seen enormous progress over the last years and has been very successful in improving our understanding in these fascinating compact objects The book addresses a wide spectrum of readers from students to senior researchers Thirteen chapters written by internationally renowned experts offer a thorough overview of the various facets of this interdisciplinary science from neutron star formation in supernovae pulsars equations of state super dense matter gravitational wave emission to alternative theories of gravity The book was initiated by the European Cooperation in Science and Technology COST Action MP1304 Exploring fundamental physics with compact stars NewCompStar

Neutron Stars: Theory and Observation J.E Ventura, David Pines, 1991-09-30 Some twenty three years after the discovery of pulsars and their identification as rotating neutron stars neutron star physics may be regarded as coming of age Pulsars and accreting neutron stars have now been studied at every wavelength from the initial radio observations through optical X and ray up to the very recent observations in the TeV region while theorists have studied in some detail relevant physical processes both outside and inside neutron stars As a result comparison of theory with observation provides a test of four theoretical ideas in fields as diverse as neutron and nuclear matter superfluidity and superconductivity the acceleration of high energy particles and the generation and maintenance of intense magnetic fields For example through observations of glitches and post glitch behavior of pulsars it has become possible to establish the presence of superfluid neutron matter in the inner crust of neutron stars and to determine some of its properties while neutron stars in compact binary systems offer one of the most efficient energy generation mechanisms known It is in fact the interactive interpretation of these diverse pieces of information that can lead to major advances in our understanding of the physics of these exotic objects and justifies the characterization of neutron stars as hadron physics laboratories

Neutron Stars 1 P. Haensel, A.Y. Potekhin, D.G. Yakovlev, 2006-11-03 The book gives an extended review of theoretical and observational aspects of neutron star physics With masses comparable to that of the Sun and radii of about ten kilometres neutron stars are the densest stars in the Universe This book describes all layers of neutron stars from the surface to the core with the emphasis on their structure and equation of state Theories of dense

matter are reviewed and used to construct neutron star models Hypothetical strange quark stars and possible exotic phases in neutron star cores are also discussed Also covered are the effects of strong magnetic fields in neutron star envelopes

Neutron Stars 1 P. Haensel, A.Y. Potekhin, D.G. Yakovlev, 2007-12-06 Neutron stars play a unique role in physics and astrophysics On the one hand they contain matter under extreme physical conditions and their theories are based on risky and far extrapolations of what we consider reliable physical theories of the structure of matter tested in laboratory On the other hand their observations offer the unique opportunity to test these theories Moreover neutron stars are important dramatic personae on the stage of modern astrophysics they participate in many astronomical phenomena

3 Neutron stars contain the matter of density ranging from a few g cm at their surface where the pressure is small to more than 10^{15} g cm at the center where the pressure exceeds 10^{36} dyn cm To calculate neutron star structure one needs the dependence of the pressure on density the so called equation of state EOS in this huge density range taking due account of temperature more than 10^9 K in young neutron stars and magnetic fields sometimes above 10^{15} G The present book is mainly devoted to the theory of the EOS of neutron star matter and its consequences for neutron star structure As one moves from the neutron star surface to the center the methods to calculate the EOS change Atomic structure and plasma theories are used for the surface stellar layers Deeper layers of the neutron star crust require nuclear theory combined with plasma physics both in very exotic density temperature regimes Finally the neutron star core necessitates many body theory of dense strongly interacting systems together with the physics of strong interactions of elementary particles

Neutron Stars and Their Birth Events Wolfgang Kundt, 2012-12-06 This volume is the documentation of the second Course on Neutron Stars Active Galactic Nuclei and Jets held at Erice in September 1988 This second Course was devoted to our knowledge about neutron star sources The poster spoke of pulsars accreting X ray sources and jet engines perhaps also UHE pulsars X ray bursters and black hole candidates Neutron stars have even been proposed as the primary cosmic ray boosters Most of their properties are still controversial such as their birth mechanism neutrino versus magnetic piston internal structure neutrons quarks strange particles magnetic thermal and spin histories wind generation hydrogen versus pair plasma radiation versus centrifugal pressure magnetospheric structure and accretion modes along field lines versus quasi Keplerian The listed controversies have largely survived through the Course and entered into the proceedings Several lecturers speak of magnetic field decay in neutron stars of the recycling of old pulsars and of accretion induced collapse of white dwarfs as though such processes were textbook knowledge Terms and abbreviations like RPSR recycled pulsar spinup line AIC and ADC accretion disk corona help to foster the assumptions It is not clear to me at this time whether any of these notions has an application to reality

Progress in Neutron Star Research Andrew P. Woss, 2005 Neutron stars are the collapsed cores of some massive stars They pack roughly the mass of our Sun into a region the size of a city Neutron stars are believed to form in supernovae such as the one that formed the Crab Nebula The stars that eventually become neutron stars are thought to start out with

about 15 to 30 times the mass of our sun It appears that for initial masses much less than 15 solar masses the star becomes a white dwarf whereas for initial masses a lot higher than 30 solar masses a black hole results instead It is estimated that there are 108 neutron stars in our galaxy About 1000 of these have actually been observed by astronomers so far This new book presents recent and important research results in the field The Neutron Star Chryssa Kouveliotou,J.E Ventura,Edward Peter Jacobus van den Heuvel,2001-12-31 Proceedings of the NATO Advanced Study Institute Elounda Crete Greece 7 18 June 1999 **Neutron Star** Larry Niven,1969 **Universal Relations for Binary Neutron Star Mergers with Long-lived Remnants** Praveen Manoharan,2022-03-28 In the last 25 years an extensive body of work has developed various equation of state independent or approximately universal relations that allow for the inference of neutron star parameters from gravitational wave observations These works however have mostly been focused on singular neutron stars while our observational efforts at the present and in the near future will be focused on binary neutron star BNS mergers In light of these circumstances the last five years have also given rise to more attempts at developing universal relations that relate BNS pre merger neutron stars to stellar parameters of the post merger object mostly driven by numerical relativity simulations In this thesis a first attempt at perturbatively deriving universal relations for binary neutron star mergers with long lived neutron star remnants is presented The author succeeds in confirming previous results relating pre merger binary tidal deformabilities to the f mode frequency of the post merger object Combining this result with recent advances of computing the f mode frequency of fast rotating neutron stars he also derives a combined relation that relates the pre merger binary tidal deformability of a BNS to the effective compactness of a long lived neutron star remnant Finally he also proposes a direct relation between these quantities with improved accuracy **Black Holes, White Dwarfs, and Neutron Stars** Stuart L. Shapiro,Saul A. Teukolsky,2008-11-20 This self contained textbook brings together many different branches of physics e g nuclear physics solid state physics particle physics hydrodynamics relativity to analyze compact objects The latest astronomical data is assessed Over 250 exercises **Physics of Neutron Star Interiors** D. Blaschke,N.K. Glendenning,A. Sedrakian,2008-01-11 Neutron stars are the densest observable bodies in our universe Born during the gravitational collapse of luminous stars a birth heralded by spectacular supernova explosions they open a window on a world where the state of the matter and the strengths of the fields are anything but ordinary This book is a collection of pedagogical lectures on the theory of neutron stars and especially their interiors at the forefront of current research It addresses graduate students and researchers alike and should be particularly suitable as a text bridging the gap between standard textbook material and the research literature **The Electromagnetic Spectrum of Neutron Stars** Altan Baykal,Sinan K. Yerli,Sitki C. Inam,Sergei Grebenev,2005 *Nuclear Science Abstracts* ,1976 Neutron Stars John Maxwell Irvine,1978 **Seven Wonders of the Sun and Other Stars** Rosanna Hansen,2011-01-01 Describes seven different phenomena of the Sun and other stars of the universe including solar storms eclipses and supernovas and explains why these phenomena occur **Astrophysics**
