**The Physics and Technology of Amorphous SiO<sub>2</sub>** Roderick A.B. Devine, 2012-12-06 The contents of this volume represent most of the papers presented either orally or as posters at the international conference held in Les rd th Arcs Savoie from June 29 to July 3 1987 The declared objective of the conference was to bring together specialists working in various fields both academic and applied to examine the state of our understanding of the physics of amorphous sio<sub>2</sub> from the point of view of its structure defects both intrinsic and extrinsic its ability to transport current and to trap charges its sensitivity to irradiation etc For this reason the proceedings is divided as was the conference schedule into a number of sections starting from a rather academic viewpoint of the internal structure of idealized SiO<sub>2</sub> and progressing 2 towards subjects of increasing technological importance such as charge transport and trapping and breakdown in thin films The proceedings terminates with a section on novel applications of amorphous SiO<sub>2</sub> and in particular buried oxide layers formed by ion implantation Although every effort was made at the conference to ensure that each presentation occurred in its most obvious session in editing the proceedings we have taken the liberty of changing the order where it seems that a paper was in fact more appropriate to an alternative section In any event because of the natural overlap of subjects many papers could have been suitably placed in several different sections

**Coherent Lightwave Communications Technology** S. Shimada, 2012-12-06 This book covers a wide range of technical issues relating to lightwave technologies using high coherence lightwaves Electromagnetic wave communication started when the first wireless system was invented by Marconi in 1895 However we had to wait about one hundred years to realize

a similar technology in the lightwave frequency region The invention of lasers in 1960 and two technology innovations in 1970 low loss silica fiber and semiconductor lasers operating at room temperature promoted the development of fiber optic transmission systems The deployment of high speed long haul fiber optic transmission systems has led to the formation of domestic and international trunk networks The installed fiber cables in local loop plants provide multimedia communication services including broadband video However present lightwave communication systems do not fully utilize the fruitful potential of lightwaves namely the capacity of extremely high frequency electromagnetic information carrier waves The frequency of lightwaves used for fiber optic transmission is about  $200 \text{ THz}$   $14.2 \times 10^{14} \text{ Hz}$  and the frequency bandwidth of the fiber low loss region is about  $13.2 \text{ THz}$   $2 \times 10^{14} \text{ Hz}$  Recent developments of narrow spectrum width semiconductor laser and planar optical waveguide devices offer us the possibilities for a new generation of lightwave based communication systems This book focuses on system aspects of the new generation lightwave communication technologies such as optical frequency division multiplexing and coherent detection Chapter 1 overviews lightwave communication system technology
