Plants Extinction Or Survival:

Plants Howard Facklam, Margery Facklam, 1990 Describes the importance of germplasm and how storage banks around the world are preserving plant seeds so that plant species will not be lost through disease and environmental conditions

1997 IUCN Red List of Threatened Plants World Conservation Monitoring Centre, 1998 This book represents the most comprehensive compilation of data on threatened vascular plants ever published It includes the names of some 33 000 plant species determined to be rare or threatened on a global scale Conservation assessments were provided by the IUCN Species Survival Commission the National Botanical Institute South Africa Environment Australia and CSIRO The Nature Conservancy the Smithsonian Institution and the Royal Botanic Gardens Kew together with hundreds of botanic gardens and botanists throughout the world The Royal Botanic Gardens Edinburgh and the New York Botanical Garden have made major in kind contributions The result of 20 years work by botanists and conservationists around the world it is intended as a conservation tool a provider of baseline information to measure conservation progress and as a primary source of data on plant species Most importantly however it provides the building blocks on which to base a worldwide effort to conserve plant species

Extinctions in the History of Life Paul D. Taylor, 2004-11-11 Extinction is the ultimate fate of all biological species over 99 percent of the species that have ever inhabited the Earth are now extinct The long fossil record of life provides scientists with crucial information about when species became extinct which species were most vulnerable to extinction and what processes may have brought about extinctions in the geological past Key aspects of extinctions in the history of life are here reviewed by six leading palaeontologists providing a source text for geology and biology undergraduates as well as more advanced scholars Topical issues such as the causes of mass extinctions and how animal and plant life has recovered from these cataclysmic events that have shaped biological evolution are dealt with This helps us to view the biodiversity crisis in a broader context and shows how large scale extinctions have had profound and long lasting effects on the Earth's biosphere

Ice Age Extinction Jim Snook, 2008 The author explores the causes of Earth's cyclical temperature changes and shows how those temperature shifts touch off a chain of events in the atmosphere in the oceans and on land Cold temperature was the trigger and the resultant reduction in carbon dioxide he argues was the bullet that killed off so many species The re warming released more carbon dioxide into the atmosphere and fueled a resurgence This book provides significant long term background information to put global warming into perspective In addition the author describes the human responses to increases in atmospheric carbon dioxide after the last ice age and in the last 150 years Near the end of the last ice age atmospheric carbon dioxide was about half of what it is today Due to the lack of carbon dioxide most of the vegetation disappeared from the middle and high latitudes Without plants to eat many large animals became extinct North America lost three fourths of its large animals including the woolly mammoth mastodon and saber tooth cat Humans too had little to eat in these areas and their population declined dramatically The book then explains how and why atmospheric carbon dioxide

increased by about 50% after the last ice age ended encouraging a population explosion among plants animals and humans all of which then migrated into many previously barren areas More recently the 28% increase in atmospheric carbon dioxide in the last 150 years has caused a six fold increase in the human population Changes in the next 300 years will reverse some of the current trends This book has value for anyone interested in the ice age extinction glaciers the glacial cycle the atmosphere and oceans and the past and future of plants animals and humans It provides long term information on atmospheric carbon dioxide global warming and cooling

Plants and Palynomorphs around the Permian-Triassic Boundary of South China Jianxin Yu, Jean Broutin, Zongsheng Lu, 2022-08-08 This book documents timely and systematically marvelous fossils plants and sporopollen related to the biggest mass extinction of the Permian Triassic transition Numerous beautiful pictures and comprehensive records on the plants of this unique and critical interval of geohistory are presented in this book It greatly contributes to understanding of the Permian Triassic plant diversity and evolution For geologists it is important to understand the Permian Triassic crisis and for students it is attractive to learn about the plants response to palaeoclimatic changes

Plants Julie Kerr Casper, 2007 Plant life is crucial life on Earth depends on plants in some way This book focuses on the many aspects that make plants such a valuable resource It examines the uses of plants and their importance as well as the goods and services they provide to communities and our high standard of living every day

Extinct Plants and Problems of Evolution Dukinfield Henry Scott, 1924

Botanic Gardens and the World Conservation Strategy, 1985

Plants and Their Environments, 1994

The Origin, Expansion, and Demise of Plant Species Donald A. Levin, 2000-05-04 Combining insights from observation experimentation and theory The Origin Expansion and Demise of Plant Species offers a broad overview of species as dynamic entities that arise have unique evolutionary histories and ultimately go extinct It begins with a review of species concepts and the exposition of a new concept it then addresses plant speciation the expansion of species from their narrow centers of origin intraspecific differentiation and contact zones between differentiated population systems Special attention is given to the breakdown of cohesion among populations by reproductive and spatial barriers Also the ecological and genetic properties of small populations and fragmented population systems are discussed with a focus on the role of hybridization in the demise of species It ends with an exploration of the longevity of species and the tempo of diversification contrasting different groups of plants in these respects as well as in rates of chromosomal differentiation This book provides a new synthesis of evolutionary biology and ecology It examines species from their origins then follows them through their expansion differentiation and loss of cohesion and decline and extinction The stages in the lives of species are viewed through ecological and genetic theory and topics typically addressed independently are woven into a continuous fabric As the first synthetic treatment of the stages through which plant species pass this book is very useful for botanists evolutionary biologists conservation biologists as well as all curious students of the biological sciences
