Chemotherapy for cancer is in a state of evolution Because some cancers can now be cured with chemotherapy as a singular modality this therapy can no longer be viewed as simply a palliative contribution Chemotherapy has assumed an important role as an adjuvant to other modalities including both surgery and radiation therapy For some tumors the primary application of chemotherapy in a combined modality approach to curative therapy has resulted in the application of less radical surgery while achieving substantial of relatively rare tumors such as cure rates Nonetheless with the exception childhood tumors hematologic malignancies and testicular cancer the effectiveness of chemotherapy in most tumors is severely limited At the cellular level greater understanding of the specific mechanism of tumor cell killing and of the phenomenon of drug resistance are elusive critical ingredients in the improvement of effectiveness in cancer chemotherapy Prolonging the exposure time of the tumor cell to drugs is a concept that was addressed in the early phases of the development of chemotherapy However technological limitations inhibited the broader application of chemotherapy by infusion until recent years Also the convenience of intermittent therapy on an outpatient basis with the predominant theory of drug effect based on a dose response as well as the proven effectiveness of this schedule in some tumors has slowed the process of subjecting infusion chemotherapy to the rigors of clinical trials *Current Research on Pre-clinical Aspects of Cancer Therapy* Current Cancer Research Project Analysis Center (U.S.), 1975 1038 references to research projects being conducted in the United States and elsewhere Entries arranged under 5 topics e g Preclinical studies of anticancer drugs Preclinical radiation therapy and Preclinical immunotherapy Entries include title researcher address contract number summary and supporting agency Indexes by subjects investigators contractors supporting agencies and contractor numbers **The Impact of Tumor Biology on Cancer Treatment and Multidisciplinary Strategies** Michael Molls, Peter Vaupel, Carsten Nieder, Mitchell Steven Anscher, 2009-03-25 The rapidly changing concepts in radiation oncology with the development of more precise instrumentation for delivery of radiation therapy and a greater emphasis on hypofractionation technologies require a very intimate knowledge of tumor biology and the influence of various biologic factors on dose distribution within the tumor in terms of homogeneity as well as prevention of any late effects on normal tissue surrounding the tumor itself Not only are these major factors in clinical practice but also the known factors of inhomogeneity of cancer cells the impact of microenvironment in terms of radiation effect and host factors make it mandatory to design therapeutic strategies to improve the outcome and to diminish any potential short term or long term risks from the radiation therapy The authors have developed an outstanding text that deals with these strategies and how they would impact on established and emerging new technologies and treatment The context of the presentations within a multidisciplinary combined modality therapy program is incredibly important In this volume various
