Mobile and Wireless Communications Networks Elizabeth M. Belding-Royer, Khaldoun Al Agha, Guy Pujolle, 2006-08-17

Mobile Ad hoc NETWORKS MANETs has attracted great research interest in recent years A Mobile Ad Hoc Network is a self organizing multi hop wireless network where all hosts often called nodes participate in the routing and data forwarding process The dependence on nodes to relay data packets for others makes mobile ad hoc networks extremely susceptible to various malicious and selfish behaviors This point is largely overlooked during the early stage of MANET research Many works simply assume nodes are inherently cooperative and benign However experiences from the wired world manifest that the reverse is usually true and many works [3, 10, 9, 8, 12, 19] have pointed out that the impact of malicious and selfish users must be carefully investigated The goal of this research is to address the cooperation problem and related security issues in wireless ad hoc networks As a rule of thumb it is more desirable to include security mechanisms in the design phase rather than continually patching the system for security breaches As pointed out in [2, 1] there can be both selfish and malicious nodes in a mobile ad hoc network Selfish nodes are most concerned about their energy consumption and intentionally drop packets to save power The purpose of malicious nodes on the other hand is to attack the network using various intrusive techniques In general nodes in an ad hoc network can exhibit Byzantine behaviors

Mobile and wireless communications applications have a clear impact on improving the humanity wellbeing From cell phones to wireless internet to home and office devices most of the applications are converted from wired into wireless communication Smart and advanced wireless communication environments represent the future technology and evolutionary development step in homes hospitals industrial vehicular and

transportation systems A very appealing research area in these environments has been the wireless ad hoc sensor and mesh networks These networks rely on ultra low powered processing nodes that sense surrounding environment temperature pressure humidity motion or chemical hazards etc Moreover the radio frequency RF transceiver nodes of such networks require the design of transmitter and receiver equipped with high performance building blocks including antennas power and low noise amplifiers mixers and voltage controlled oscillators Nowadays the researchers are facing several challenges to design such building blocks while complying with ultra low power consumption small area and high performance constraints CMOS technology represents an excellent candidate to facilitate the integration of the whole transceiver on a single chip However several challenges have to be tackled while designing and using nanoscale CMOS technologies and require innovative idea from researchers and circuits designers While major researchers and applications have been focusing on RF wireless communication optical wireless communication based system has started to draw some attention from researchers for a terrestrial system as well as for aerial and satellite terminals This renewed interested in optical wireless communications is driven by several advantages such as no licensing requirements policy no RF radiation hazards and no need to dig up roads besides its large bandwidth and low power consumption This second part of the book Mobile and Wireless Communications Key Technologies and Future Applications covers the recent development in ad hoc and sensor networks the implementation of state of the art of wireless transceivers building blocks and recent development on optical wireless communication systems We hope that this book will be useful for students researchers and practitioners in their research studies

Mobile and Wireless Communications with Practical Use-Case Scenarios Ramona Trestian, 2022-12-22 The growing popularity of advanced multimedia rich applications along with the

increasing affordability of high end smart mobile devices has led to a massive growth in mobile data traffic that puts significant pressure on the underlying network technology. However, no single network technology will be equipped to deal with this explosion of mobile data traffic. While wireless technologies had a spectacular evolution over the past years, the present trend is to adopt a global heterogeneous network of shared standards that enables the provisioning of quality of service and quality of experience to the end user. To this end, enabling technologies like machine learning, Internet of Things, and digital twins are seen as promising solutions for next generation networks that will enable an intelligent adaptive interconnected environment with support for prediction and decision making so that the heterogeneous applications and users requirements can be highly satisfied. The aim of this textbook is to provide the readers with a comprehensive technical foundation of the mobile communication systems and wireless network design and operations and applications of various radio access technologies. Additionally, it also introduces the reader to the latest advancements in technologies in terms of Internet of Things ecosystems, machine learning, and digital twins for IoT enabled intelligent environments. Furthermore, this textbook also includes practical use case scenarios using Altair WinProp Software as well as Python TensorFlow and Jupyter as support for practice based laboratory sessions.
