Delay Tolerant Networks Athanasios V. Vasilakos, Yan Zhang, Thrasyvoulos Spyropoulos, 2016-04-19 A class of Delay Tolerant Networks DTN which may violate one or more of the assumptions regarding the overall performance characteristics of the underlying links in order to achieve smooth operation is rapidly growing in importance but may not be well served by the current end to end TCP IP model Delay Tolerant Networks Protocols and Applicat

RFID Technologies for Internet of Things Min Chen, Shigang Chen, 2016-11-02 This book introduces applications of RFID on the Internet of things under the emerging technologies for tag search anonymous RFID authentication and identification of networked tags A new technique called filtering vector a compact data structure that encodes tag IDs is proposed to enable tag filtration meeting the stringent delay requirements for real world applications Based on filtering vectors a novel iterative tag search protocol is designed which progressively improves the accuracy of search result and reduces the time of each iteration by using the information learned from the previous iterations Moreover the protocol is extended to work under noisy channel The authors also make a fundamental shift from the traditional design paradigm for anonymous RFID authentication by following an asymmetry design principle that pushes most complexity to the readers while leaving the tags as simple as possible A novel technique is developed to dynamically generate random tokens on demand for authentication The token based authentication protocol only requires O 1 communication overhead and online computation overhead per authentication for both readers and tags Finally the authors investigate the problem of networked tag identification The traditional contention based protocol design will incur too much energy overhead in multihop tag systems and a reader coordinated design that significantly serializes tag transmissions performs much better In addition a solution based on serial numbers is proposed to achieve load balancing thereby reducing

the worst case energy cost among the tags Designed for researchers and professionals this SpringerBrief will interest individuals who work in efficiency security and privacy Advanced level students focused on network design will also benefit from the content

Encyclopedia on Ad Hoc and Ubiquitous Computing Dharma P. Agrawal, Dr. Bin Xie, 2010 Ad hoc and ubiquitous computing technologies have received extensive attention in both the academia and industry with the explosive growth of wireless communication devices These technologies are beneficial for many applications such as offering futuristic high bandwidth access for users and are expected to offer more exciting and efficient services anytime and anywhere In order to satisfy these diverse applications the design issues of various wireless networks such as ad hoc sensor and mesh networks are extremely complicated and there are a number of technique challenges that need to be explored involving every layer of the OSI protocol stack This book aims to provide a complete understanding of these networks by investigating the evolution of ad hoc sensor and mesh networking technologies from theoretic concept to implementation protocols from fundamentals to real applications It provides the necessary background material needed to go deeper into the subject and explore the research literature The explanation in the book is therefore sufficiently detailed to serve as a comprehensive reference for students instructors researchers engineers and other professionals building their understanding of these networks

iNetSec 2009 - Open Research Problems in Network Security Jan

Camenisch,Dogan Kesdogan,2009-11-02 The working group WG 11.4 of IFIP ran an iNetSec conference a few times in the past sometimes together with IFIP security conference sometimes as a stand alone workshop with a program selected from peer reviewed submissions When we were elected to chair WG 11.4 we asked ourselves whether the security and also the computer science community at large benefits from this workshop In particular as there are many too many security conferences it has become difficult to keep up with the field After having talked to many colleagues far too many to list all of them here we decided to try a different kind of workshop one where people would attend to discuss open research topics in our field as typically only happens during the coffee breaks of ordinary conferences

To enable this we called for abstracts of 2 pages where the authors outline the open problems that they would like to discuss at the workshop the intent being that the author would be given 15 minutes to present the topic and another 15 minutes for discussion These abstracts were then read by all members of the Program Committee and ranked by them according to whether they thought this would lead to an interesting talk and discussion We then simply selected the abstracts that got the best rankings We were happy to see this result in many really interesting talks and discussions in the course of the workshop Of course these lively and direct discussions are almost impossible to achieve in a printed text Still we asked the authors to distill the essence of these discussions into full papers The results are in your hands

Future Intent-Based Networking Mikhailo Klymash, Mykola Beshley, Andriy Luntovskyy, 2021-12-09 So called Intent Based Networking IBN is founded on well known SDN Software Defined Networking and represents one of the most important emerging network infrastructure opportunities The IBN is the beginning of a new era in the history of networking where the network itself translates business intentions into appropriate network configurations for all devices This minimizes manual effort provides

an additional layer of network monitoring and provides the ability to perform network analytics and take full advantage of machine learning. The centralized software defined solution provides process automation and proactive problem solving as well as centralized management of the network infrastructure. With software based network management many operations can be performed automatically using intelligent control algorithms, artificial intelligence and machine learning. As a result network operation costs, application response times and energy consumption are reduced, network reliability and performance are improved, network security and flexibility are enhanced. This will be a benefit for existing networks as well as evolved LTE based mobile networks, emerging Internet of Things (IoT), Cloud systems and soon for the future 5G/6G networks. The future networks will reach a whole new level of self awareness, self configuration, self optimization, self recovery and self protection. This volume consists of 28 chapters based on recent research on IBN. The volume is a collection of the most important research for the future intent based networking deployment provided by different groups of researchers from Ukraine, Germany, Slovak Republic, Switzerland, South Korea, China, Czech Republic, Poland, Brazil, Belarus and Israel. The authors of the chapters from this collection present in depth extended research results in their scientific fields. The presented contents are highly interesting while still being rather practically oriented and straightforward to understand. Herewith we would like to wish all our readers a lot of inspiration by studying of the volume.
