NIOSH Alert National Institute for Occupational Safety and Health, Centers for Disease Control and Prevention (U.S.), 2004 Recent evidence in the Alert summarized on this poster documents that worker exposure to hazardous drugs is a persistent problem Although most air sampling studies have not demonstrated significant airborne concentrations of these drugs the sampling methods used in the past have come into question Larson et al 2003 and may not be a good indicator of contamination in the workplace In all studies involving examination of surface wipe samples researchers have determined that surface contamination of the workplace is common and widespread Also a number of recent studies have documented the excretion of several indicator drugs in the urine of health care workers Results from studies indicate that worker exposure to hazardous drugs in health care facilities may result in adverse health effects Appropriately designed studies have begun and are continuing to characterize the extent and nature of health hazards associated with these ongoing exposures NIOSH is currently conducting studies to further identify potential sources of exposure and methods to reduce or eliminate worker exposure to these drugs To minimize these potentially acute short term and chronic long term effects of exposure to hazardous drugs at work NIOSH recommends that at a minimum employers and health care workers follow the recommendations presented in this Alert

Levy, 2005 **Preventing Occupational Exposures to Antineoplastic and Other Hazardous Drugs I** National Institute Safety and Health, 2015-03-13 The adverse health effects associated with antineoplastic agents cancer chemotherapy drugs cytotoxic drugs in cancer patients and some non cancer patients treated with these drugs are well documented The very

nature of antineoplastic agents make them harmful to healthy cells and tissues as well as the cancerous cells For cancer patients with a life threatening disease there is certainly a great benefit to treatment with these agents However for the health care workers who are exposed to antineoplastic agents as part of their work practice precautions should be taken to eliminate or reduce exposure as much as possible Pharmacists who prepare these drugs or nurses who may prepare and or administer them are the two occupational groups who have the highest potential exposure to antineoplastic agents Additionally physicians and operating room personnel may also be exposed through the treatment of patients Hospital staff such as shipping and receiving personnel custodial workers laundry workers and waste handlers all have potential exposure to these drugs during the course of their work The increased use of antineoplastic agents in veterinary oncology also puts these workers at risk for exposure to these drugs
