Weidemüller, 2013-11-11 With the advent of heavy ion reactions nuclear physics has acquired a new frontier The new heavy ion sources operating at electrostatic accelerators and the high energy experiments performed at Berkeley Dubna Manchester and Orsay have opened up the field and have shown us impressive new prospects The new accelerators now under construction at Berlin Daresbury and Darmstadt as well as those under consideration GANIL Oak Ridge etc are expected to add significantly to our knowledge and understanding of nuclear properties This applies not only to such exotic topics as the existence and lifetimes of superheavy elements or the possibility of shock waves in nuclei but also to such more mundane issues as high spin states new regions of deformed nuclei and friction forces The field promises not only to produce a rich variety of interesting phenomena but also to have wide spread theoretical implications Heavy ion reactions are characterized by the large masses of the fragments as well as the high total energy and the large total angular momentum typically involved in the collision A purely quantum mechanical description of such a collision process may be too complicated to be either possible or interesting We expect and in some cases know that the classical limit the limit of geometrical optics a quantum statistical or a hydrodynamical description correctly account for typical features      *Encyclopedia of Iron, Steel, and Their Alloys (Online Version)* George E.
