**Surfactant Systems** Sahil Jain, 2007      *Screening of Mixed Surfactant Systems*, 1993 A systematic chemical screening study was conducted on selected anionic nonionic and nonionic nonionic systems The objective of the study was to evaluate and determine combinations of these surfactants that would exhibit favorable phase behavior and solubilization capacity The effects of different parameters including a salinity b temperature c alkane carbon number c hydrophilic lipophilic balance HLB of nonionic component and d type of surfactant on the behavior of the overall chemical system were evaluated The current work was conducted using a series of ethoxylated nonionic surfactants in combinations of several anionic systems with various hydrocarbons Efforts to correlate the behavior of these mixed systems led to the development of several models for the chemical systems tested The models were used to compare the different systems and provided some guidelines for formulating them to account for variations in salinity oil hydrocarbon number and temperature The models were also evaluated to determine conformance with the results from experimental measurements The models provided good agreement with experimental results X ray computed tomography CT was used to study fluid distributions during chemical enhanced oil recovery experiments CT monitored corefloods were conducted to examine the effect of changing surfactant slug size injection on oil bank formation and propagation Reducing surfactant slug size resulted in lower total oil production Oil recovery results however did not correlate with slug size for the low concentration alkaline mixed surfactant system used in these tests The CT measurements showed that polymer mobility control and core features also affected the overall oil recovery results

*The Curvature Model for Mixed Surfactant Microemulsion Systems* Arti Suresh Bhakta, 2007 The objectives of this work were to develop a simple procedure to determine the hydrophilic lipophilic nature of surfactants based on microemulsion phase behavior and to characterize mixed surfactant systems The concept of hydrophilic lipophilic difference HLD and the net average curvature NAC were used to develop a model to characterize systems containing anionic anionic and anionic nonionic surfactant mixtures Salinity and temperature scans were carried out and phase changes were noted It was found that in anionic anionic systems the linear mixing rule is applicable and was used to calculate the intrinsic curvature parameter  $C_i$  which can be used as an alternative scale to the HLB and packing factor to characterize the behavior of a surfactant in microemulsion systems For anionic nonionic systems the linear mixing rule does not apply because of the interactions between anionic and nonionic surfactants which seem to be dominated by the charge shielding effect that nonionic surfactants have on anionic surfactants
