Mobility Management in Wireless Networks Karen Q. Tian,Donald C. Cox,2007-05-08 In wireless communication systems the network keeps track of a user s location through an up to date user profile stored in various databases A user profile contains not only a user s current location information but also service information such as billing and authentication The coverage area of an access network is divided into registration areas RAs and each RA is associated with a location database The two basic operations in mobility management are location update and location lookup When a user moves across the boundaries of these RAs the network updates his location information in the pertinent databases When a caller places a call using the callee s identification the network queries the relevant database s to obtain the current location and other service information of the callee The performance of mobility management can be further enhanced by using replicas of user profiles which may be kept at various locations Replication techniques make profile information more readily available thus reducing lookup cost and latency but to keep these replicas consistent and fresh they must be updated whenever the user profile is updated The principle of replication is to replicate if the benefit of replication is greater than its overhead The difficulty however lies in accurately measuring the benefit and overhead

Regulation and the Performance of Communication and Information Networks Gerald R. Faulhaber,Gary Madden,Jeffrey Petchey,2012-01-01 Due to their economic characteristics and also to their consequences on many aspects of collective life information networks have always been at the edge of regulatory innovations and at the center of policy debates The contributors of this volume combine long term visions of the factors determining regulatory policies with up to date analyses of technicalities to be dealt with to provide the reader with an extended understanding of the issues and constraints shaping the future of digital networks Eric Brousseau Universit Paris Dauphine France and the European University Institute Italy Digital markets worldwide are in rapid flux The Internet and World Wide Web have traditionally evolved in a largely deregulated environment but recently governments have shown great interest in this rapidly developing sector and are imposing regulations for a variety of reasons that are changing the shape of these industries This book explores why the industrial organization of broadband ISPs Internet backbone providers and content application providers are in such turmoil The expert contributors straddle the turbulent past of the telecoms sector and also contribute to its exciting though unpredictable future via positive analysis of past communications policies which is then utilized to deduce lessons to guide future policy making decisions It is illustrated that broadband ISPs no longer simply provide a conduit for service delivery they are also involved in producing content and transaction services themselves in competition with content and delivery providers The blurring of the traditional lines between these three sectors as each enters into the others markets is highlighted The conclusion is that we are witnessing the emergence of powerful competing platforms linked in complex ways that challenge traditional economic analyses Exploring governance issues regulation and investment next generation service markets and wireless communication this book will prove a fascinating and illuminating read for scholars researchers post graduate students and policymakers with an interest in ICT technology and innovation economics and industrial organization
