Thermal Management of Electronic Systems II E. Beyne, C.J.M. Lasance, J. Berghmans, 2012-12-06 For the second time the Eurotherm Committee has chosen Thermal Management of Electronic Systems as the subject for its 45th Seminar held at IMEC in Leuven Belgium from 20 to 22 September 1995 After the successful first edition of this seminar in Delft June 14 16 1993 it was decided to repeat this event on a two year basis This volume constitutes the edited proceedings of the Seminar Thermal management of electronic systems is gaining importance Whereas a few years ago papers on this subject were mainly devoted to applications in high end markets such as mainframes and telecommunication switching equipment we see a growing importance in the lower end applications This may be understood from the growing impact of electronics on every day life from car electronics GSM phones personal computers to electronic games These applications add new requirements to the thermal design The thermal problem and the applicable cooling strategies are quite different from those in high end products In this seminar the latest developments in many of the different aspects of the thermal design of electronic systems were discussed Particular attention was given to thermal modelling experimental characterisation and the impact of thermal design on the reliability of electronic systems

*Variation-Aware Analog Structural Synthesis* Trent McConaghy, Pieter Palmers, Gao Peng, Michiel Steyaert, Georges Gielen, 2009-07-13 This book describes new tools for front end analog designers starting with global variation aware sizing and extending to novel variation aware topology design The tools aid design through automation but more importantly they also aid designer insight through automation We now describe four design tasks each more general than the previous and how this book contributes design aids and insight aids to each The first designer task targeted is global robust sizing This task is supported by a design tool that does automated globally reliable variation aware sizing SANGRIA and an insight aiding tool that extracts designer interpretable whitebox models that relate sizings to circuit performance CAFFEINE SANGRIA searches on several levels of problem difficulty simultaneously from lower cheap to evaluate exploration layers to higher full evaluation exploitation layers structural homotopy SANGRIA makes maximal use of circuit simulations by performing scalable data mining on simulation results to

choose new candidate designs CAFFEINE accomplishes its task by treating function induction as a tree search problem. It constrains its tree search space via a canonical functional form grammar and searches the space with grammatically constrained genetic programming. The second designer task is topology selection. Topology selection tools must consider a broad variety of topologies such that an appropriate topology is selected, must easily adapt to new semiconductor process nodes and readily incorporate new topologies. Topology design tools must allow designers to creatively explore new topology ideas as rapidly as possible.

**Simulation Efficiency of Analog Behavioral Models - Analyses and Improvements** Daniel Platte, 2008. *The Electronic Design Automation Handbook* Dirk Jansen, 2010-02-23. When I attended college we studied vacuum tubes in our junior year. At that time an average radio had five vacuum tubes and better ones even seven. Then transistors appeared in the 1960s. A good radio was judged to be one with more than ten transistors. Later good radios had 15-20 transistors and after that everyone stopped counting transistors. Today modern processors running personal computers have over

10milliontransistorsandmoremillionswillbeaddedevery year The difference between 20 and 20M is in complexity methodology and business models Designs with 20 tr sistors are easily generated by design engineers without any tools whilst designs with 20M transistors can not be done by humans in reasonable time without the help of Prof Dr Gajski demonstrates the Y chart automation This difference in complexity introduced a paradigm shift which required sophisticated methods and tools and introduced design automation into design practice By the decomposition of the design process into many tasks and abstraction levels the methodology of designing chips or systems has also evolved Similarly the business model has changed from vertical integration in which one company did all the tasks from product speci cation to manufacturing to globally distributed client server production in which most of the design and manufacturing tasks are outsourced
