Tests and Proofs Gordon Fraser, Angelo Gargantini, 2010-06-17 This volume contains the proceedings of TAP 2010 the 4th International Conference on Tests and Proofs held during July 12 in Malaga Spain as part of TOOLS Federated Conferences TAP 2010 was the fourth event of an ongoing series of conferences devoted to the convergence of proofs and tests In the past proving and testing were seen as very different and even competing techniques Proving people would say If correctness is proved what do we need tests for Testers on the other hand would claim that proving is too limited in applicability and testing is the only true path to correctness Of course both have a point but to quote Ed Brinksma from his 2009 keynote at the Dutch Testing Day and Testcom FATES Who would want to fly in an airplane with software proved correct but not tested Indeed the true power lies in the combination of both approaches Today modern test systems rely on techniques deeply rooted in formal proof techniques and testing techniques make it possible to apply proof techniques where there was no possibility previously At a time when even mainstream software engineering conferences start featuring papers with both testing and proving in their titles we are clearly on the verge of a new age where testing and proving are not competing but naturally accepted as complementary techniques Albeit we are not quite there yet and so the TAP conferences aim to provide a forum for researchers working on the converging topics and to raise general awareness of this convergence

Gilster,2013-04-18 I wrote this book because I wanted to learn more about interstellar flight Not the Star Trek notion of tearing around the Galaxy in a huge spaceship that was obviously beyond existing technology but a more realistic mission In 1989 I had videotaped Voyager 2's encounter with Neptune and watched the drama of robotic exploration over and over again I started to wonder whether we could do something similar with Alpha Centauri the nearest star to the Sun Everyone seemed to agree that manned flight to the stars was out of the question if not permanently then for the indefinitely foreseeable future But surely we could do something with robotics And if we could figure out a theoretical way to do it how far were we from the actual technology that would make it happen In other words what was the state of our interstellar technology today those concepts and systems that might translate into a Voyager to the stars Finding answers meant talking to people inside and outside of NASA I was surprised to learn that there is a large literature of interstellar flight Nobody knows for sure how to propel a spacecraft fast enough to make the interstellar crossing within a time scale that would fit the conventional idea of a mission but there are candidate systems that are under active investigation Some of this effort begins with small systems that we'll use near the Earth and later hope to extend to deep space missions

Classic graph problems made temporal - a parameterized complexity analysis Molter, Hendrik,2020 This thesis investigates the parameterized computational complexity of six classic graph problems lifted to a temporal setting More specifically we consider problems defined on temporal graphs that is a graph where the edge set may change over a discrete time interval while the vertex set remains unchanged Temporal graphs are well suited to model dynamic data and hence they are naturally motivated in contexts where dynamic changes or time dependent interactions play an important role such as for example communication networks social networks or physical proximity networks The most important selection criteria for our problems was that they are well motivated in the context of dynamic data analysis Since temporal graphs are mathematically more complex than static graphs it is maybe not surprising that all problems we consider in this thesis are NP hard We focus on the development of exact algorithms where our goal is to obtain fixed parameter tractability results and refined computational hardness reductions that either show NP hardness for very restricted input instances or parameterized hardness with respect to large parameters In the context of temporal graphs we mostly consider structural parameters of the underlying graph that is the graph obtained by ignoring all time information However we also consider parameters of other types such as ones trying to measure how fast the temporal graph changes over time In the following we briefly discuss the problem setting and the main results

Restless Temporal Paths A path in a temporal graph has to respect causality or time which means that the edges used by a temporal path have to appear at non decreasing times We investigate temporal paths that additionally have a maximum waiting time in every vertex of the temporal graph Our main contributions are establishing NP hardness for the problem of finding restless temporal paths even in very restricted cases and showing W[1] hardness with respect to the feedback vertex

number of the underlying graph

Temporal Separators

A temporal separator is a vertex set that when removed from the temporal graph destroys all temporal paths between two dedicated vertices. Our contribution here is twofold. Firstly, we investigate the computational complexity of finding temporal separators in temporal unit interval graphs, a generalization of unit interval graphs to the temporal setting. We show that the problem is NP hard on temporal unit interval graphs, but we identify an additional restriction which makes the problem solvable in polynomial time. We use the latter result to develop a fixed parameter algorithm with a distance to triviality parameterization. Secondly, we show that finding temporal separators that destroy all restless temporal paths is P 2 hard.

Temporal Matchings

We introduce a model for matchings in temporal graphs where if two vertices are matched at some point in time, then they have to recharge afterwards, meaning that they cannot be matched again for a certain number of time steps. In our main result, we employ temporal line graphs to show that finding matchings is NP hard, even on instances where the underlying graph is a path.

Temporal Coloring

We lift the classic graph coloring problem to the temporal setting. In our model, every edge has to be colored properly, that is, the endpoints are colored differently at least once in every time interval of a certain length. We show that this problem is NP hard in very restricted cases, even if we only have two colors. We present simple exponential time algorithms to solve this problem. As a main contribution, we show that these algorithms presumably cannot be improved significantly.

Temporal Cliques and s Plexes

We propose a model for temporal s plexes that is a canonical generalization of an existing model for temporal cliques. Our main contribution is a fixed parameter algorithm that enumerates all maximal temporal s plexes in a given temporal graph, where we use a temporal adaptation of degeneracy as a parameter.

Temporal Cluster Editing

We present a model for cluster editing in temporal graphs where we want to edit all layers of a temporal graph into cluster graphs that are sufficiently similar. Our main contribution is a fixed parameter algorithm with respect to the parameter number of edge modifications plus the measure of similarity of the resulting clusterings. We further show that there is an efficient preprocessing procedure that can provably reduce the size of the input instance to be independent of the number of vertices of the original input instance.
