Fischer, We are born with a number sense the ability to respond to numerosity which we share with other vertebrates This inherited numerosity representation is approximate and follows the Weber Fechner law that governs sensory perception As educated adults we can also use culturally developed abstract symbol systems to represent exact numerosities in particular number words and Arabic numbers This developmental stage is preceded by an apparently transient phase of finger counting and finger calculation In fact the use of fingers to represent number is ubiquitous across ages and cultures Children use finger counting even if they are discouraged to do so sometimes even before they are able to utter the number word sequence Furthermore finger counting strategies may also be used by adults diagnosed with dyscalculia to make up for a deficient or absent mental number representation The advantages of finger counting are evident Fingers are readily available and perceptually salient finger numerical representations support short term memory and they provide a transparent one to one relationship between to be counted objects and their representation Obviously however these advantages only hold for small numbers Fully transparent finger counting systems are limited to the number range between zero and ten Larger numbers can only be represented in perceptually less salient or symbolic ways In recent years a growing body of evidence has suggested that finger based representations of number do not form an arbitrary and transient stage of cognitive development Rather they seem to provide a good example of embodied cognition According to this influential viewpoint all of our knowledge is represented together with the sensory and motor activity that was present

during its acquisition As a consequence even a supposedly abstract cognitive ability such as numerical cognition reuses the neural substrate and inherits functional properties of more basic perceptual and or motor processes Consistent with this assumption finger counting habits and numerical processing do interact even in educated adults casting doubts on purely abstract accounts of mental number representations The objective of this Research Topic is to document embodiment signatures in number processing and calculation a domain of cognition that was long considered to epitomize the abstract symbol manipulation approach to human cognition To this end we invite empirical contributions using different methodologies including behavioural developmental neuroscientific educational cross cultural and neuropsychological studies Moreover we also seek theoretical contributions review articles or opinion papers Questions to be tackled may include but are not restricted to the following Is finger counting only a useful or even a necessary step towards the acquisition of symbolic number representations What are the neural correlates of the finger number relationship Which features of finger counting influence adult number processing both approximate and exact How can finger counting systems be classified typologically and how do different finger counting systems influence numerical cognition across cultures and populations Should finger counting and finger calculation be promoted or discouraged in maths education How are disturbances of finger gnosis and numerical abilities linked We hope that this Research Topic will bring together researchers from different backgrounds to fruitfully discuss a topic which has both scientific and every day relevance

Kitano,C.B. Suttner,1997-02-10 The third in an informal series of books about parallel processing for Artificial Intelligence  
this volume is based on the assumption that the computational demands of many AI tasks can be better served by parallel  
architectures than by the currently popular workstations However no assumption is made about the kind of parallelism to be  
used Transputers Connection Machines farms of workstations Cellular Neural Networks Crays and other hardware  
paradigms of parallelism are used by the authors of this collection The papers arise from the areas of parallel knowledge  
representation neural modeling parallel non monotonic reasoning search and partitioning constraint satisfaction theorem  
proving parallel decision trees parallel programming languages and low level computer vision The final paper is an  
experience report about applications of massive parallelism which can be said to capture the spirit of a whole period of  
computing history This volume provides the reader with a snapshot of the state of the art in Parallel Processing for Artificial  
Intelligence      **Math Phonics - Subtraction (eBook)** Marilyn B. Hein,1997-03-01 In just minutes a day students can

System Stephen Kerr,2007-06-18 What if you could solve any Sudoku puzzle with a bare minimum of penciling in and erasing  
usually one or two penciled in numbers per cell and never more than three no educated guesses and do it in less than half the  
time it takes you to solve a puzzle now Well we have developed an incredibly simple yet amazingly powerful system which  
limits the confusion of having four five or more contingencies penciled in for each cell and can solve almost any Sudoku  
puzzle This is not to say that we have taken the logic or the challenge out of solving Sudoku puzzles we have not You must  
still be thoughtful thorough and sometimes imaginative but you will have much MORE FUN solving them with much less

everything you need to integrate math manipulatives both concrete and virtual into math learning Each chapter of this richly  
illustrated easy to use guide focuses on a different powerful tool such as two color counters linking cubes base ten blocks  
fraction manipulatives pattern blocks tangrams geometric solids and others and includes a set of activities that demonstrate  
the many ways teachers can leverage manipulatives to model and reinforce math concepts for all learners      **Parallel**

**Processing for Artificial Intelligence 1** L.N. Kanal,H. Kitano,V. Kumar,C.B. Suttner,2014-06-28 Parallel processing for AI  
problems is of great current interest because of its potential for alleviating the computational demands of AI procedures The

articles in this book consider parallel processing for problems in several areas of artificial intelligence image processing knowledge representation in semantic networks production rules mechanization of logic constraint satisfaction parsing of natural language data filtering and data mining The publication is divided into six sections The first addresses parallel computing for processing and understanding images The second discusses parallel processing for semantic networks which are widely used means for representing knowledge methods which enable efficient and flexible processing of semantic networks are expected to have high utility for building large scale knowledge based systems The third section explores the automatic parallel execution of production systems which are used extensively in building rule based expert systems systems containing large numbers of rules are slow to execute and can significantly benefit from automatic parallel execution The exploitation of parallelism for the mechanization of logic is dealt with in the fourth section While sequential control aspects pose problems for the parallelization of production systems logic has a purely declarative interpretation which does not demand a particular evaluation strategy In this area therefore very large search spaces provide significant potential for parallelism In particular this is true for automated theorem proving The fifth section considers the problem of constraint satisfaction which is a useful abstraction of a number of important problems in AI and other fields of computer science It also discusses the technique of consistent labeling as a preprocessing step in the constraint satisfaction problem Section VI consists of two articles each on a different important topic The first discusses parallel formulation for the Tree Adjoining Grammar TAG which is a powerful formalism for describing natural languages The second examines the suitability of a parallel programming paradigm called Linda for solving problems in artificial intelligence Each of the areas discussed in the book holds many open problems but it is believed that parallel processing will form a key ingredient in achieving at least partial solutions It is hoped that the contributions sourced from experts around the world will inspire readers to take on these challenging areas of inquiry
