Nutrient-induced Responses In Eukaryotic Cells:

Nutrient-Induced Responses in Eukaryotic Cells Joris Winderickx, Peter M. Taylor, 2004-03-29 Cells of all living organisms have the ability to respond to altered nutritional conditions. They have developed mechanisms to sense nutrient availability and to produce appropriate responses which involve changes in gene expression and the production or degradation of certain enzymes and other proteins. In recent years the understanding of nutrient induced signal transduction has greatly advanced and the emerging picture is that nutrient signalling mechanisms evolved early in evolution. This book provides a detailed presentation and comparison of the key nutritional regulatory mechanisms in lower as well as higher eukaryotes written by recognised experts in this expanding field.

Ecology of Saprotrophic Basidiomycetes Lynne Boddy,Juliet Frankland,Pieter van West,2007-12-29 The breadth and depth of understanding of many areas concerning basidiomycetes has increased dramatically since the premier publication of Frankland et al Decomposer Basidiomycetes their Biology and Ecology New vistas have opened up with the advent of powerful computing modeling and molecular approaches helping to greatly increase the general understanding of the ecology of basidiomycetes This is tantamount to understanding the role of fungi in natural ecosystems because they are major agents of decomposition and nutrient cycling These remarkable advances have been incorporated into this volume that discusses all aspects of saprotrophic basidiomycete ecology

Fungi in Biogeochemical Cycles Geoffrey Michael Gadd,2006-05-04 Fungi play important roles in the cycling of elements in the biosphere but are frequently neglected within microbiological and geochemical research spheres Symbiotic mycorrhizal fungi are responsible for major transformations and redistribution of inorganic nutrients while free living fungi have major roles in the decomposition of organic materials including xenobiotics Fungi are also major biodeterioration agents of stone wood plaster cement and other building materials and are important components of rock inhabiting microbial communities The aim of this book is to promote further understanding of the key roles that free living and symbiotic fungi in mycorrhizas and lichens play in the biogeochemical cycling of elements the chemical and biological mechanisms that are involved and their environmental and biotechnological significance Where appropriate relationships with bacteria are also discussed to highlight the dynamic interactions that can exist between these major microbial groups and their integrated function in several kinds of habitat

Crop Production for Agricultural Improvement Muhammad Ashraf,Münir Öztürk,Muhammad Sajid Aqeel Ahmad,Ahmet Aksoy,2012-06-02 In the recent years the looming food scarcity problem has highlighted plant sciences as an emerging discipline committed to devise new strategies for enhanced crop productivity The major factors causing food scarcity are biotic and abiotic stresses such as plant pathogens salinity drought flooding nutrient deficiency or toxicity which substantially limit crop productivity world wide In this scenario strategies should be adopted to achieve maximum productivity and economic crop returns In this book we have mainly focused on physiological biochemical molecular and genetic bases of crop development and related approaches that can be used for crop improvement under environmental adversaries In addition the adverse effects of different biotic diseases pathogens etc and abiotic salinity drought high temperatures metals etc stresses on crop development and the potential strategies to enhance crop productivity under stressful environments are also discussed

Crop Improvement Khalid Rehman Hakeem,Parvaiz Ahmad,Munir Ozturk,2013-06-13 The improvement of crop species has been a basic pursuit

since cultivation began thousands of years ago To feed an ever increasing world population will require a great increase in food production Wheat corn rice potato and few others are expected to lead as the most important crops in the world Enormous efforts are made all over the world to document as well as use these resources Everybody knows that the introgression of genes in wheat provided the foundation for the Green Revolution Later also demonstrated the great impact that genetic resources have on production Several factors are contributing to high plant performance under different environmental conditions therefore an effective and complementary use of all available technological tools and resources is needed to meet the challenge

Plant signaling: Understanding the molecular crosstalk Khalid Rehman Hakeem, Reiaz Ul Rehman, Inayatullah Tahir, 2013-10-25 Plant signalling has emerged as an integrated field which has become indispensable in recent times to study any biological process Over the last decade an enormous amount of information has been generated in this field and the advances in information technology gave birth to bioinformatics which has helped greatly in managing the galaxy of information It is now possible to view the different information s in a systems biology approach which has unravelled the association new processes and thus helped us enormously in understanding of the biological processes The present book is an attempt at understanding the plant signalling processes with different perspectives Even though the plants are sessile but there exists a tremendous interconnected network of perception at morphological physiological and molecular levels The impact of the surrounding environment in terms of abiotic and biotic stresses is significant in terms of its survival adaptation and productivity for the human welfare The plants possess a wide array of processes at the organ tissue and cellular levels which are governed by a plethora of molecules The molecules govern individual processes and these exists a cross talk between them to form a complex network of processes The book tries to envision how different processes are operating at different points in the life cycle of the plant

Yeasts in the Production of Wine Patrizia Romano, Maurizio Ciani, Graham H. Fleet, 2019-09-16 It is well established that certain strains of yeasts are suitable for transforming grape sugars into alcohol while other yeast strains are not suitable for grape fermentations Recent progress has clearly demonstrated that the sensory profile of a wine is characteristic of each vine cultivated and the quality and technological characteristics of the final product varies considerably due to the strains which have performed and or dominated the fermentation process Because of their technological properties wine yeast strains differ significantly in their fermentation performance and in their contribution to the final bouquet and quality of wine such as useful enzymatic activities and production of secondary compounds related both to wine organoleptic quality and human health The wine industry is greatly interested in wine yeast strains with a range of specialized properties but as the expression of these properties differs with the type and style of wine to be made the actual trend is in the use of selected strains which are more appropriate to optimize grape quality Additionally wine quality can be influenced by the potential growth and activity of undesirable yeast species considered spoilage yeasts which cause sluggish and stuck fermentation and detrimental taste and aroma in the wine
