Mobile Messaging Technologies and Services Gwenaël Le Bodic, 2005-07-08 Building on the success of the first edition Mobile Messaging Technologies and Services offers extensive new and revised material based upon the latest research and industry developments While early implementations targeted person to person messaging MMS has now evolved to facilitate such requirements as the mass delivery of time sensitive messages for content to person messaging This Second Edition exploits the technical maturity of MMS as it is poised to generate a wealth of new business opportunities across the mobile communications sector The author provides the fundamental technical background required for SMS EMS and MMS and supports this with industry cutting edge developments Contains a revised section on the fundamentals of MMS including an updated section on GPRS to explain current commercial implementations such as GRX applications Presents the latest developments in MMS standardization including the design of synchronized multimedia integration language SMIL presentations Digital Rights Management DRM transcoding techniques postcard service and support of advanced multimedia formats Describes the processes for standardizing telecommunications services and technologies 3GPP OMA GSM Association IETF and W3C Provides updated sections on SMS EMS and heavily revised coverage of the developments in MMS including MMS interworking and the forthcoming MMS version 1.3 This resource will be invaluable for application developers manufacturers operators and content providers involved in the design and deployment of messaging services It will also be of interest to practitioners involved in the process of standardizing telecommunications services and technologies Postgraduate students and researchers will benefit from having access to state of the art findings backed by numerous illustrative real world examples Includes a companion website featuring information on relevant standards available phones and developers resources

Mobile Messaging Technologies and Services Gwenaël Le Bodic, 2003-06-13 Mobile messaging is practically the first data communication service in the wireless domain It is a major advance on the conventional practice of providing only voice communication service over the wireless interface Thus mobile messaging is the initial step to bring the Internet to wireless terminals and has considerable importance both for mobile communication and the Internet Mobile Messaging provides an in depth description of messaging technologies supported by mobile networks It covers the Short Message Service SMS Enhanced Messaging Service EMS through to the more complex and emerging Multimedia Messaging Service MMS The Short Message System SMS has proved to be incredibly popular and is supported by most GSM TDMA and CDMA mobile networks This volume focuses on the Short Message Service introduced by the European Telecommunications Standard Institute ETSI for GSM and GPRS networks On the basis of ETSI standard the 3rd Generation Partnership Project 3GPP is currently the organisation responsible for maintaining the SMS technical specifications In its most basic form the Short Messaging Service allows users to exchange short messages composed of a limited amount of text and it is expected that up to 100 Billion short messages could be exchanged monthly by the end of

2002 The Enhanced Message Service EMS an application level extension of SMS supersedes basic SMS features by allowing elements such as images animations formatted text and monophonic melodies to be inserted in short or concatenated messages Recently the 3GPP has been focusing on the development of the Multimedia Message Service MMS MMS features include the exchange of messages containing polyphonic melodies large images video elements sometimes organised with a multimedia presentation language such as SMIL or xHTML MMS will be supported by 2.5 G and 3G networks MMS specifications have reached a fairly mature stage and MMS commercial solutions are appearing on the market Unlike EMS MMS has been specified by the 3GPP as a service independent from the underlying network technologies In parallel to the 3GPP standardisation process other organisations have specified network specific implementations of MMS such as the WAP implementation defined by the WAP Forum In order to develop applications using Short Enhanced and Multimedia messaging technologies engineers have to become familiar with the use of technical specifications produced by various standard development organisations such as the 3GPP the WAP Forum and the IETF and this is the first book to pull this vast array of material together Provides an in depth description of the different messaging services and messaging technologies Presents an introduction to mobile networks Features numerous practical implementation examples Provides a unique easy to follow presentation of messaging services and mobile networks within a single publication Essential reading for content providers service providers network operators and telecommunications manufacturers researchers postgraduate students marketing and standardisation personnel

Enabling Technologies for Wireless E-Business Weidong Kou, Yelena Yesha, 2006-12-15 Advances in wireless technologies promise to revolutionize the way we conduct business This book provides complete coverage of the enabling technologies needed to make wireless e business effective These include wireless security mobile payment location based services mobile data management and RFID technologies The authors are highly distinguished Dr Weidong Kou is a Chief Architect and a Senior Manager of IBM Greater China Group and a Laureate of 2004 Friendship Award of China Dr Yelena Yesha is an Exceptional Research Professor in the Department of Computer Science and Electrical Engineering at the University of Maryland This book is an ideal introduction for both self study and taught e business classes or commercial training Digital Image and Signal Processing for Measurement Systems J. Richard Duro, Lopez Fernando Pena, 2022-09-01 This book provides an overview of advanced digital image and signal processing techniques that are currently being applied in the realm of measurement systems The book is a selection of extended versions of the best papers presented at the Sixth IEEE International Workshop on Intelligent Data Acquisition and Advanced Computing Systems Technology and Applications IDAACS 2011 related to this topic and encompass applications that go from multidimensional imaging to evoked potential detection in brain computer interfaces The objective was to provide a broad spectrum of measurement applications so that the different techniques and approaches could be presented Digital Image and Signal Processing for Measurement Systems concentrates on signal processing for measurement systems and its objective is to provide a general overview of the area and

an appropriate introduction to the topics considered This is achieved through 10 chapters devoted to current topics of research addressed by different research groups within this area These 10 chapters reflect advances corresponding to signals of different dimensionality They go from mostly one dimensional signals in what would be the most traditional area of signal processing realm to RGB signals and to signals of very high dimensionality such as hyperspectral signals that can go up to dimensionalities of more than one thousand The chapters have been thought out to provide an easy to follow introduction to the topics that are addressed including the most relevant references so that anyone interested in this field can get started in the area They provide an overview of some of the problems in the area of signal and image processing for measurement systems and the approaches and techniques that relevant research groups within this area are employing to try to solve them which in many instances are the state of the art of some of these topics

An Investigation into

Authentication Security of GSM algorithm for Mobile Banking Ali Raheem,2014-02-01 Due to the mobility of its users GSM systems are vulnerable to an unauthorized access and eaves droppings when compared with the traditional fixed wired networks The main idea of this project is to develop an application device in order to secure mobile banking over unsecure GSM network It is important to mention that mobile banking is a term that is used for performing balance checks account transactions payments credit applications and many other online applications Unfortunately the security architecture for cellular network is not entirely secure As a matter of fact GSM network infrastructure is proved to be insecure Many possible attacks are documented in literature For security was never considered in the initial stages the sending of protective banking information across an open mobile phone network remains insecure Consequently this project focuses entirely on the development and design of security techniques in order to asses some security issues within mobile banking through cellular phone network GSM The main aim of this project is to investigate and examine the following 1 Security issues in each level of the mobile network architecture 2 Messages and signals exchanged between user s cellular phone and mobile network at each level 3 The overall security architecture of GSM flaws 4 Some existing security measures for mobile transactions 5 The current security within SMS banking and GPRS banking Finally two folded simulations in MATLABT were performed using OFDM which is a broadband multicarrier modulation method that provides a high performance operation to transmitted and received data or information

Multimedia Services in Intelligent Environments George A Tsihrintzis,2008-07-02

Multimedia services involve processing transmission and retrieval of multiple forms of information Multimedia services have gained momentum in the past few years due to the easy availability of computing power and storage media Societyisdemandinghuman likeintelligentbehaviour suchasadaptationand generalization from machines every day With this view in mind researchers are working on fusing intelligent paradigms such as arti cial neural networks swarm intelligence arti cial immune systems evolutionary computing and multiagents with multimedia services Arti cial neural networks use neurons interconnected using various schemes for fusing learning in multimedia based systems Evolutionary c puting

techniques are used in tasks such as optimization Typical multiagent systems are based on Belief Desire Intention model and act on behalf of the users Typical examples of intelligent multimedia services include digital libraries e learning and teaching e government e commerce e entertainment e health and e legal services This book includes 15 chapters on advanced tools and methodologies pertaining to the multimedia services The authors and reviewers have contributed immensely to this research oriented book We believe that this search volume will be valuable to professors researchers and students of all disciplines such as computer science engineering and management We express our sincere thanks to Springer Verlag for their wonderful editorial support
