Harris,2012-12-06 Dramatic changes in the attitudes toward human nutrition have taken place during the past decade Food related and medical professionals as well as consumers are now more than ever before aware of and concerned about diet nutrition and the beneficial and deleterious effects of food processing upon nutrients The old saying We are what we eat is still relevant Nutritious food will contribute greatly to consumers good health and ultimately reduce medical bills Food processing is essential to maintaining our food reserves from one harvest to another thus letting us serve our daily meals regularly If food processing is defined as including all treatments of foodstuffs from harvest to consumption then more than 95% of our food may be considered as processed In most cases food processing and storage cause some reduction in the nutritional value of foods Advances in food science and food technology have resulted in an increase in nutrient retention after processing In addition today's consumer better understands how to avoid excessive nutrient losses during food preparation The information presented in this completely revised reference and textbook will help the reader to understand better the relationship between food processing and nutrient retention The authors' scholarly contributions are greatly appreciated **Diet and Training Strategies to Optimize Health Parameters** Luis Suarez-Arrones,Gabriele Mascherini,Pascal Izzicupo,Fábio Yuzo Nakamura,Javier Benítez-Porres,Alejandro Galán-Mercant,Mora Murri,Cristian Petri,2025-02-21 The importance of exercise for public health is evident Diet is an essential component for optimizing the adaptation to physical exercise Various diets and training methods have emerged as popular options both in clinical and sports contexts due to their capacity to alter body composition athletic performance and cardiovascular and metabolic health Proper nutrition provides the body with essential nutrients such as carbohydrates proteins and healthy fats which are necessary for physical activity and recovery It has been shown that nutritional supports and healthy habits related to resistance and aerobic training are linked not only to positive effects in the reduction of body mass in people affected by obesity but also to reduced blood concentrations of low density lipoprotein LDL triacylglycerol and glucose and increased blood high density lipoprotein HDL content In addition there is evidence of the benefits of some diets in treating or managing diseases like neurological endocrine and cardiovascular disorders and certain types of cancer **Front-of-Package**
